Notice: The W3000 controller software is protected by a digital signature.

This means that it can only work on boards supplied by Climaveneta and not on boards purchased from other dealers.

1 USER INTERFACE

There are three types of user interface:

Depending on the type of user interface installed, there are more or less keys available for controlling the unit and for accessing system information.

| Key | | Description |
|----------------------|------------------|--|
| W3000, W3000 base | W3000 compact | |
| | | [MENU key]: accesses the main menu. |
| | | [UP key]: moves around the masks and sets control parameter values |
| | | [DOWN key]: moves around the masks and sets control parameter values |
| | | [ENTER key]: confirms entered data. |
| | | [ESC key]: goes back one level in the mask tree if you are in the header masks, or returns to the unit controller. |
| | | [ALARM key]: displays the alarms and resets normal operating conditions. |
| | --- | [SETPOINT key]: directly accesses the setpoint menu. |
| | --- | [ON/OFF key]: switches the machine on and off. |

For each compressor, the following LED's are also located on the W3000 user interface:

| Symbol | Colour | Description |
|--------|--------|---|
| | Green | If the LED shines steady the compressor is on, if it flashes the compressor is demanded |
| | Red | The compressor is blocked by a compressor or circuit alarm |
| | Green | The compressor is in the "chiller" mode |
| | Green | The circuit is in the "freecooling" mode |
| | Green | The compressor is in the "heat pump" mode |
| | Green | If the LED shines steady the circuit is in the "recovery mode", if it flashes there is a "recovery alarm" |
| | Green | If the LED shines steady the circuit is in the "defrost mode", if it flashes it is in the "drip mode" |

1.1 Menu structure

The tree structures for moving around the various menus are shown below.

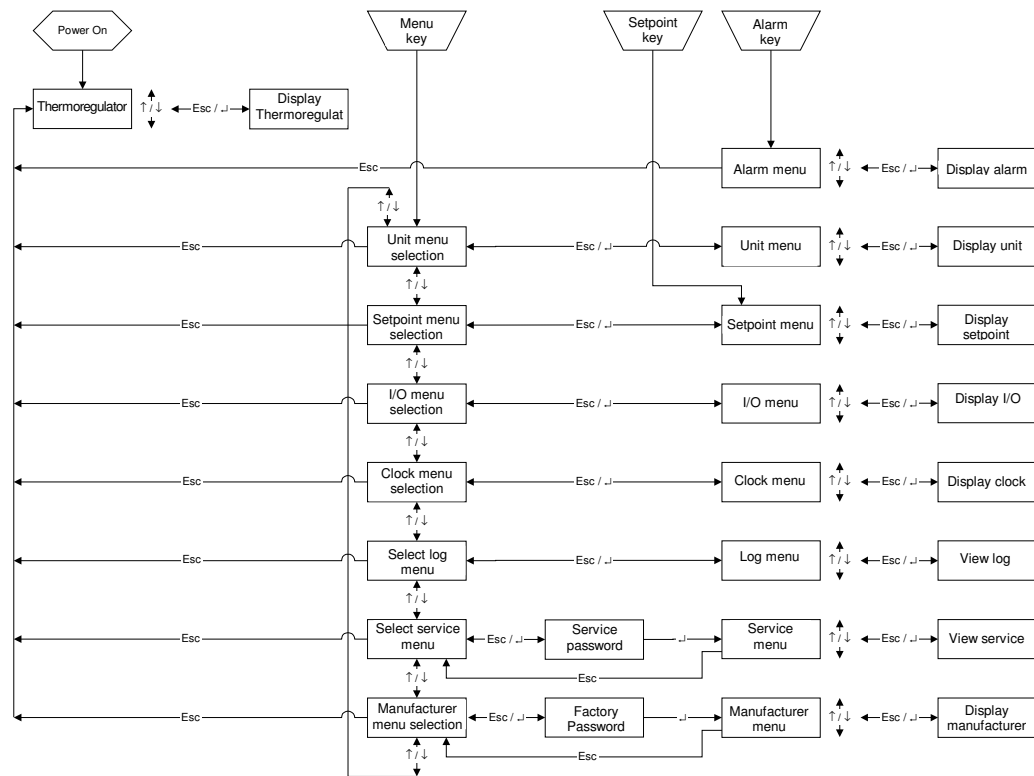

Figure 1.1: menu tree for W3000-W3000 compact

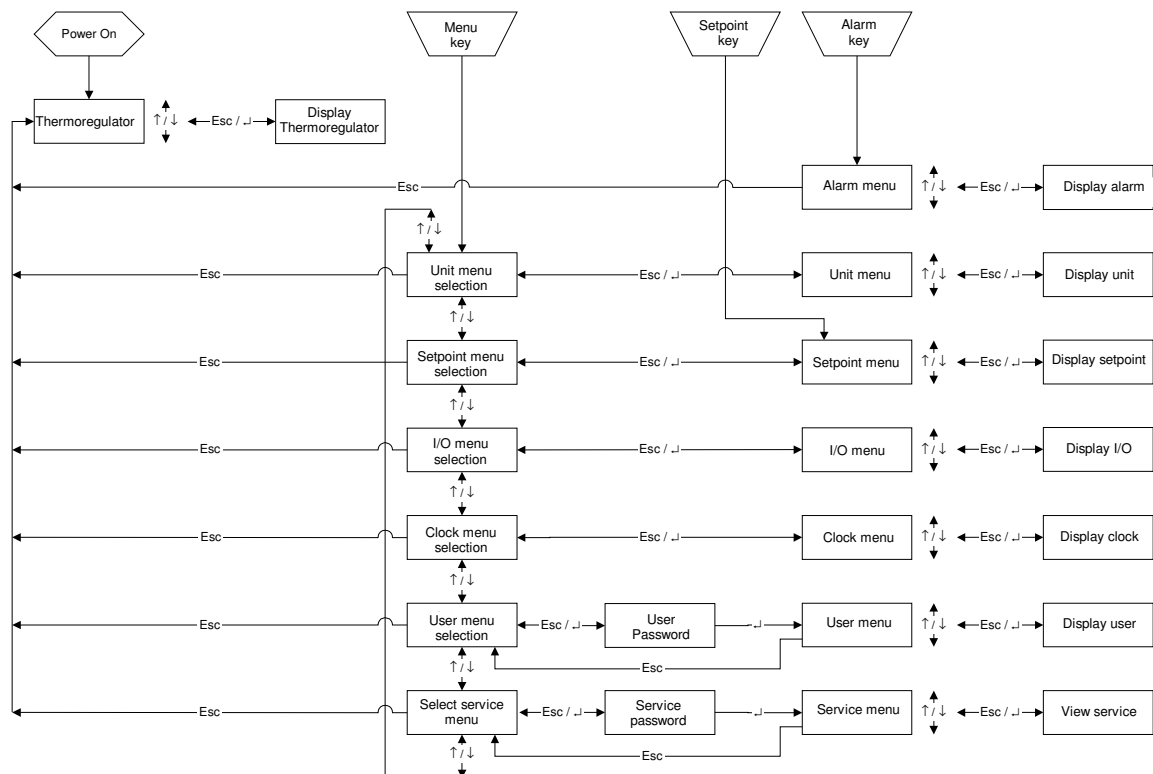

Figure 1.2: menu tree for W3000 base

The menus are briefly described below:

- The "Unit Menu" displays information such as temperature, pressure and circuit states.
- The "Setpoint menu" is used to set the setpoints for the various available functions. Different setpoints can be set depending on the available operating modes (chiller, heat pump and recovery). Dual setpoint values can also be set for chiller and heat pump operation (only if the digital input is fitted and the "dual setpoint" function is enabled in the "user menu").
- The "I/O menu" shows the status of the digital inputs and values read from the analogue inputs. It also shows the status of the digital outputs and the voltage supplied to the analogue outputs. If expansions are necessary (depending on the configuration parameters), the inputs and outputs of the latter are also shown.
- Parameters relative to user programming of the unit can be displayed and set in the "User menu".
- Unit configuration parameters can be displayed and set in the "manufacturer menu".
- Service engineers can view and set parameters in the "Assistance menu".
- The list of alarm events recorded by the unit can be displayed in the "Log menu" (only accessible if the clock card is installed).
- The "Clock menu", if the clock board is present, is used to set and display the date and time and configure the time bands (except for W3000 base).

After enabling time bands from the "enable time bands" parameter in the "user menu", time bands can be set and specific operating modes and different setpoints can be set according to requirements.

Several time bands (up to 10) of different types (A, B, C and D) can be set during the day.

Figure 1.3 shows an example: the beginning of the first time band is set at 00:00 and the end of the tenth time band is set at 23:59; the end of one time band determines the beginning of the following one.

To use a smaller number of bands, set the time a band ends to the same time it begins, and that band will be ignored. Summer and winter setpoints and unit On/Off switching can be set for each time band. If the unit is switched Off, it will remain in the "Off from time bands" mode.

Figure 1.3: example of setting time bands

1.2 Switching the unit on and off

Caution: connect the unit to the power supply at least 8 hours before starting it; if this is not done, the guarantee will become null and void.

There are different procedures for starting or stopping the unit: using the user interface keys or selecting from the display. The following procedures have a priority. In the event of conflicts between different settings, the following priorities apply:

- | | |
|---------------------|---|
| - highest priority: | on/off from keypad - on/off from parameter on/off from digital input on/off from time bands |
| - lowest priority: | on/off from protocol |

using the [ON/OFF] key:

For W3000 and W3000 base

Proceed as follows:

- **SWITCHING ON:** press the [ON-OFF] key.
- **SWITCHING OFF:** press the [ON-OFF] key.

In the W3000, the message Com. : ON appears on the display

In the W3000 base, the message "On" appears on the display with the LED on, or "OFF" with the LED off.

using the On/Off parameter:

For W3000 and W3000 compact

The "Com: On/Off" parameter can be displayed on the user interface. "Off" means that the unit is switched off while "On" means that the unit is switched on.

Proceed as follows:

- **SWITCHING ON:** Move to the "On/Off" parameter by pressing [Enter] and then press [Up] or [Down] until "On" appears. Press [Enter] again to confirm. If "On" continues to be displayed it means that the unit has been switched on.
- **SWITCHING OFF:** Move to the "On/Off" parameter and change to "Off" using the same procedure used to switch the unit on. Press [Enter] again to confirm. If "Off" continues to be displayed it means that the unit has been switched on.

using the digital input:

Only if the digital input is fitted.

Open the "user menu" and check that the "On/Off enable from digital input" parameter is set to "Yes".

When the contact is open the unit is "Off", when the contact is closed the unit is "On".

Proceed as follows:

- **SWITCHING ON:** Close the remote On/Off contact. The "On from digital input" message appears in the main mask to show that the unit has been switched on.
- **SWITCHING OFF:** Open the remote On/Off contact. The "Off from digital input" message appears in the main mask to show that the unit has been switched off.

In the W3000 base the following procedure is used: press [MENU] / select the "User" menu using the [UP] or [DOWN] keys / press [ENTER] to access the menu / press enter to type in the password / press [UP] or [DOWN] to choose the password and [ENTER] to confirm / use the [UP] or [DOWN] keys to choose the "dI 0" (Enable from digital input) mask / press [ENTER] to view the current setting of the parameter ("Y" or "N") / press [ENTER] to modify the parameter (the display flashes) / press [UP] or [DOWN] to select one of the two alternatives. Press the "digital input" button on the panel to switch the unit on and off.

using time bands:

For W3000 and W3000 compact (if the clock board is fitted)

Make sure that the "Clock board not installed" is not displayed in the "clock menu".

Check that the "Time bands enabled" parameter in the "user menu" is set to "Yes".

- **SWITCHING ON:** set the required switching on time in the "clock menu". The unit switches on when the set time is reached. The "On from time bands" message appears in the main mask to show that the unit has been switched on. N.B.: The unit does not switch on if it is set to "Off from keypad" or "Off from digital input".
- **SWITCHING OFF:** set the required switching off time in the "clock menu". The unit switches off when the set time is reached. The "Off from time bands" message appears in the main mask to show that the unit has been switched off.

using the supervision protocol:

Only if the serial board is fitted.

Check that the "Supervisor enable" and "On/Off enable from supervisor" parameters in the "user menu" are set to "Yes".

Proceed as follows:

- **SWITCHING ON:** Send the switching on command from the protocol. The "On from supervisor" message appears in the main mask to show that the unit has been switched on. N.B.: The unit does not switch on if it is set to "Off from keypad" or "Off from digital input".
- **SWITCHING OFF:** Send the switching off command from the protocol. The "Off from supervisor" message appears in the main mask to show that the unit has been switched off.

In the W3000 base the following procedure is used: press [MENU] / select the User menu using the [UP] or [DOWN] keys / press [ENTER] to access the menu / press enter to type in the password / press [UP] or [DOWN] to choose the password and [ENTER] to confirm / use the [UP] or [DOWN] keys to choose the "SPr" (Enable from supervisor) mask / press [ENTER] to view the current setting / press [ENTER] to see the display flashing / press [UP] or [DOWN] to modify the setting and press [ENTER] to confirm.

1.3 Setting the operating mode

Caution: Do not switch from chiller to heat pump unless the inlet temperature is above 15°C. Do not switch from heat pump to chiller unless the inlet water temperature is below 30°C.

There are various ways of setting the operating mode of the unit.

The set operating mode may be any one of the following, as long as they are compatible with the unit:

| Operating mode | | Description |
|----------------|-------------------|--------------------------------------|
| | <i>W3000 base</i> | |
| chiller | ch | Chiller |
| chiller+rec | | Chiller plus recovery |
| heatpump | hp | Heat pump |
| summer ch | | Chiller in summer mode |
| summer ch+rec | | Chiller plus recovery in summer mode |
| summer rec | | Recovery in summer mode |
| recovery | | Recovery only |
| summer auto | | Automatic in summer mode |
| winter hp | | Heat pump in winter mode |
| winter rec | | Recovery in winter mode |
| winter auto | | Automatic in winter mode |
| auto | | Automatic |

The following procedures have a priority: in the event of conflicts between opposing settings the following priorities apply:

- highest priority: change through parameter
chiller/heat pump from digital input
ch/ch+rec from digital input
- lowest priority: change through protocol

Using the parameter:

Make sure the unit is "Off". Access the "setpoint menu" and display the "Operating mode" parameter. Move to the "Operating mode" parameter by pressing [Enter] and modify the parameter by pressing [Up] or [Down]. Press [Enter] again to confirm. If the set message continues to be displayed it means that operating mode has been changed.

In the W3000 base the key sequence is: switch off the unit using the [ON/OFF] key / press the [setpoint] key / select MODE with the [UP] or [DOWN] keys / press [Enter] / press [Enter]. At this point the cursor flashes. Press the [UP] or [DOWN] keys to select either "ch"= chiller or "hp"= heat pump. Press [Enter] to confirm.

Using the digital input:

Only for heat pump units and only if the digital input is present.

Check that the "Chiller/Hp enable from digital input" parameter in the "user menu" is set to "Yes". When the contact is open the unit is in the "heat pump" mode, when the contact is closed the unit is in the "chiller" mode. Switching the digital input switches the unit off, changes the operating mode and switches the unit on again.

In the W3000 base access the "user menu" / select "DI S" by pressing the [UP or DOWN] key/ press [Enter] to view the current setting / press [Enter] to see the current setting flashing and change it using the [UP or DOWN] key / press [Enter] to confirm the new setting.

Using the recovery from digital input command:

Only for "chiller plus recovery" units and only if the digital input is present. This mode is not present in the W3000 base.

Proceed as follows: check that the "Recovery control enable from digital input" parameter in the "Recovery menu" is set to "Yes".

When the contact is open the unit is in the "chiller+rec" mode, when the contact is closed the unit is in the "chiller" mode. Switching the digital input switches the unit off, changes the operating mode and switches the unit on again.

Using the supervision protocol:

Only applicable if the serial board is fitted.

Check that the "Supervisor enable" and "Enable operating mode from supervisor" parameters in the "user menu" are set to "Yes".

Make sure the unit is "Off". Send the change operating mode command from the protocol. The operating mode only changes if the unit is switched off.

In the W3000 base press [ON/OFF] to switch the unit off. Access the "user menu" / press [UP] or [DOWN] to select "SV M"/ press [Enter] to view the set mode / press [Enter] to see the setting flashing / press [UP] or [DOWN] to modify the setting / press [Enter] to confirm the new setting.

Send the change operating mode command from the protocol. The operating mode only changes if the unit is switched off.

1.4 Setting adjustment methods

Depending on the type of compressor used, various adjustment methods may be selected.

| Compressor | Unit | Adjustment method |
|-------------|--|---|
| Hermetic | Water/water heat pump Water/water chiller Evaporating units Water/air heat pump Water/air chiller Chiller with heat recovery | <ul style="list-style-type: none"> • <i>Quick Mind on outlet probe</i> • <i>Quick Mind on inlet probe</i> • <i>Proportional step on inlet probe</i> • <i>Proportional step on inlet probe + integral on inlet probe</i> |
| | Chiller with free-cooling Energy Raiser Heat pump with heat recovery | <ul style="list-style-type: none"> • <i>Proportional step on inlet probe</i> • <i>Proportional step on inlet probe + integral on inlet probe</i> |
| Alternative | Chiller with free-cooling Energy Raiser Heat pump with recovery Chiller with heat recovery Water/water heat pump Water/water chiller Evaporating units Water/air heat pump Water/air chiller | <ul style="list-style-type: none"> • <i>Proportional step on inlet probe</i> • <i>Proportional step on inlet probe + integral on inlet probe</i> |
| Screw | Water/water heat pump Water/water chiller Evaporating units Water/air heat pump Water/air chiller Chiller with heat recovery Chiller with freecooling | <ul style="list-style-type: none"> • <i>Modulating on outlet probe</i> • <i>Proportional step on inlet probe</i> • <i>Proportional step on inlet probe + integral on inlet probe</i> |
| | Energy Raiser Heat pump with recovery | <ul style="list-style-type: none"> • <i>Proportional step on inlet probe</i> • <i>Proportional step on inlet probe + integral on inlet probe</i> |
| Centrifuge | Water/water chiller Water/air chiller | <ul style="list-style-type: none"> • <i>Proportional on inlet probe + integral on outlet probe</i> |

Table 1.1: adjustment methods available by compressor type

The various adjustment methods are described below.

1.4.1 Proportional step adjustment on inlet probe

Some examples of proportional "step" adjustment on the inlet temperature probe:

Figure 1.4: T_{in} is the inlet variable, P_{out} is the percentage of delivered power (chiller).

■ = Set + proportional band/2

Figure 1.5: T_{in} is the inlet variable, P_{out} is the percentage of delivered power (heat pump).

■ = Set + proportional band/2

The following *tables* show some typical values for the parameters in question. The theoretical maximum and minimum outlet temperature values refer to operation at nominal flow rates (with a thermal head at the evaporator of 5 °C and sufficient water in the system to ensure a litre / KW ratio equal to or greater than 7).

| N° steps | Setpoint (°C) | Proportional band (°C) | Theoric min. outlet T (°C) | Theoric max. outlet T (°C) |
|-----------------|----------------------|-------------------------------|-----------------------------------|-----------------------------------|
| 2 | 9.5 | 2.5 | 5.7 | 10.8 |
| 4 | 7 | 5 | 5.7 | 8.3 |

Table 1.2: *normal setpoint and proportional band values according to the number of steps (chiller).*

| N° steps | Setpoint (°C) | Proportional band (°C) | Theoric min. outlet T (°C) | Theoric max. outlet T (°C) |
|-----------------|----------------------|-------------------------------|-----------------------------------|-----------------------------------|
| 2 | 42.5 | 2.5 | 41.2 | 46.3 |
| 4 | 45 | 5 | 43.7 | 46.3 |

Table 1.3: *normal setpoint and proportional band values according to the number of steps (heat pump).*

1.4.2 Proportional step adjustment on inlet probe + integral on inlet probe

This adjustment method is based on the sum of two components: proportional and integral. The proportional component generates the percentage demand for activating/deactivating the steps, as illustrated in the previous paragraph "Proportional step adjustment on inlet probe". The integral component adds the integral error to the proportional component at regular intervals (integral time: parameter 55.02). The integral error is calculated according to the following formula:

$$\text{Integral error} = \frac{\text{Inlet temperature} - \text{Setpoint}}{\text{Proportional band}} \times 100 \quad [\%]$$

However, the integral component is limited (integral limit: parameter 55.03) to prevent the adjustment from becoming unstable.

If the inlet temperature varies by 5% or more in one second, a rapid change, therefore, the integral component is not calculated.

Fig 1.6 Example of a 2 step adjustment in the chiller mode

1.4.3 Quick mind adjustment

Users only need set the required setpoint as the other parameters are adapted to the system by the Quick Mind algorithm. The values normally used are:

| | |
|------------------------------|---------|
| SETPOINT Chiller on inlet | 11.0 °C |
| SETPOINT Chiller on outlet | 7.0 °C |
| SETPOINT Heat pump on inlet | 42.5 °C |
| SETPOINT Heat pump on outlet | 45.0 °C |

QUICK MIND is a self-adapting algorithm for adjusting the temperature of the water treated by an all-in-one unit. The following *figure* shows how this adjustment is made:

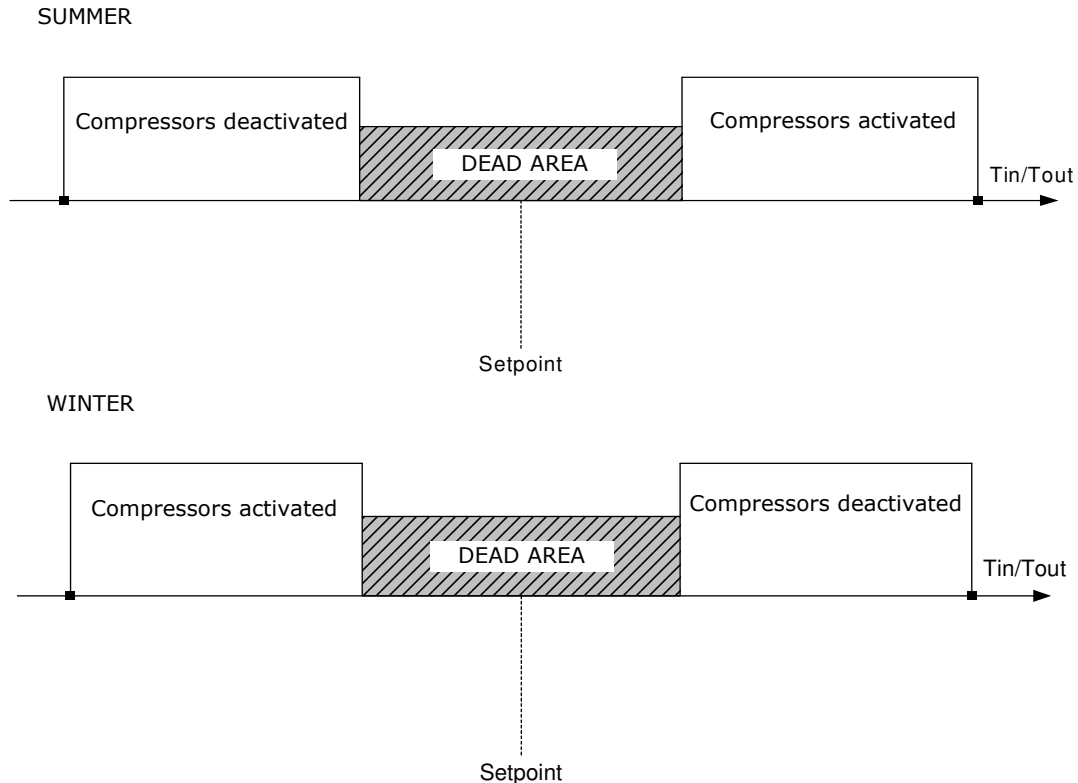

Figure 1.7: QUICK MIND adjustment model (chiller and heat pump)

The setpoint remains within a dead area. If the temperature also remains within this area, no change is made to the number of active compressors.

When the temperature leaves the dead area following a change in system load, the compressors are either activated or deactivated in order to return the temperature to the dead area.

The amplitude of the neutral zone depends on the dynamic characteristics of the system and, in particular, on the amount of water it contains and the load. The self-adapting algorithm is able to "measure" system dynamics and calculate the minimum dead area in order to respect compressor activation times and the maximum number of start-ups per hour.

Both return and delivery temperatures can be adjusted.

Special functions are also present which reduce the number of compressor start-ups in the event of very low loads or start-ups of units with significantly higher or lower temperatures than the setpoint.

| | | | | | | | | | |
|---|------|-----|-----|-----|-----|-----|-----|-----|-----|
| <i>2 compressors - with maximum permitted number of start-ups per hour 8</i> | | | | | | | | | |
| Litres/kW | 10.5 | 9.5 | 8.5 | 7.5 | 6.5 | 5.5 | 4.5 | 3.5 | 2.5 |
| Δ Tout | 3.2 | 3.2 | 3.4 | 3.4 | 3.6 | 3.8 | 4.0 | 4.4 | 5.2 |
| <i>2 compressors - with maximum permitted number of start-ups per hour 12</i> | | | | | | | | | |
| Litres/kW | 10.5 | 9.5 | 8.5 | 7.5 | 6.5 | 5.5 | 4.5 | 3.5 | 2.5 |
| Δ Tout | 3.0 | 3.0 | 3.0 | 3.2 | 3.2 | 3.4 | 3.6 | 3.8 | 4.3 |
| <i>4 compressors - with maximum permitted number of start-ups per hour 8</i> | | | | | | | | | |
| Litres/kW | 10.5 | 9.5 | 8.5 | 7.5 | 6.5 | 5.5 | 4.5 | 3.5 | 2.5 |
| Δ Tout | 1.8 | 1.8 | 1.8 | 1.8 | 1.8 | 1.9 | 2.0 | 2.3 | 2.7 |
| <i>4 compressors - with maximum permitted number of start-ups per hour 12</i> | | | | | | | | | |
| Litres/kW | 10.5 | 9.5 | 8.5 | 7.5 | 6.5 | 5.5 | 4.5 | 3.5 | 2.5 |
| Δ Tout | 1.8 | 1.8 | 1.8 | 1.8 | 1.8 | 1.9 | 2.0 | 2.3 | 2.7 |

Table 1.4: maximum theoretical delivery temperature range at constant part load (depending on the quantity of water contained in the system)

An example of real data acquired during operation with the Quick Mind adjuster on the delivery side is shown below.

Reference is made to the following figure:

| | | |
|----------------------------------|---|----------------------------------|
| Fase di avviamento controllato | = | Controlled starting phase |
| Adattamento zona neutra | = | Adaptation to dead area |
| Temperatura uscita evaporatore | = | Outlet temperature of evaporator |
| Temperatura ingresso evaporatore | = | Inlet temperature of evaporator |
| 1 compressore attivo | = | 1 compressor active |
| 2 compressori attivi | = | 2 compressors active |

Figure 1.8: example of real data with quick-mind outlet adjustment (x-axis: time in [s]; y-axis: Tout in [°C]).

This is an example of start-up with a very high initial temperature compared with the setpoint (7°C). About 10 seconds after data acquisition began, one compressor switches on. The second compressor does not switch on immediately as the algorithm which handles start-up checks if one compressor is enough to return delivery temperature to the setpoint and avoid unnecessary start-ups. As the delivery temperature is still at 12 °C after about 200 seconds, the second compressor is also switched on, otherwise it would take too long to reach setpoint.

Following the controlled starting phase, the delivery temperature falls until it "enters" the dead area. The algorithm (at t= 350 s) begins to adapt the amplitude of the dead area in order to respect compressor safety times. As can be seen, the dead area is later reduced (t= 780 s, 950 s) to the absolute minimum amplitude which allows safety times to be respected. It can also be seen that the compressors are activated and deactivated when the outlet temperature reaches the upper or lower limits of the dead area. The example shows that outlet temperature varies by about 3.5 °C during regular operation.

1.4.4 Modulating adjustment of screw compressors

With screw compressors, modulating adjustment is performed on the outlet probe. Modulating adjustment is only available on "Bitzer" screw compressors.

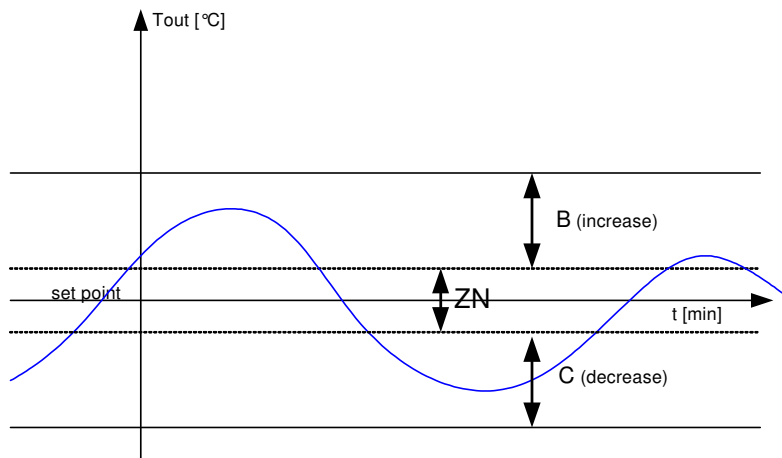

Figure 1.9: modulating adjustment for screw compressors

Reference is made to the *figure to the left*:

The setpoint remains within a dead area. If the temperature also remains within this zone, no change is made to the number of active compressors or their load percentages (position of modulating chamber).

When the temperature rises above zone B following a change in the system load, the compressors are activated in order to return the temperature to the dead area.

Inside zone B, if the outlet temperature derivative is positive, compressor power is increased in order to return the temperature to the dead area (ZN). The further away the temperature is from the setpoint, the greater the increase is.

When the temperature falls below zone C following a change in the system load, the compressors are either deactivated in order to return the temperature to the dead area.

Inside zone C, if the outlet temperature derivative is negative, compressor power is decreased in order to return the temperature to the dead area (ZN). The further away the temperature is from the setpoint, the greater the decrease is.

The amplitude of the neutral zone depends on the dynamic characteristics of the system and, in particular, on the amount of water it contains and the load. The self-adapting algorithm is able to "measure" system dynamics and calculate the minimum dead area in order to respect compressor activation times and the maximum number of start-ups per hour.

When a second or subsequent compressor is switched on, the ones that are already running are forced to a minimum, and the subsequent power increases/decreases are applied to all the compressors.

1.4.5 Adjustment method for centrifuge compressors

Adjustment is combined on the inlet temperature and integral on the outlet temperature. Some diagrams outlining how this works are shown below.

Suppose we have a single compressor unit.

Figure 1.10: Adjustment for a single-compressor unit. Min=theoretical minimum electrical power absorbed by a compressor, Max=theoretical maximum electrical power absorbed by a compressor

Let us take a close look at how the compressor is activated.

When the system return temperature lies in zone A (figure 1.11a) or less than the setpoint, the compressor is off. The amplitude of zone A normally coincides with the temperature difference at the evaporator with the compressor running at minimum power.

When the return temperature exceeds zone A (figure 1.11b), the compressor is switched on and then switches off if the temperature falls below the setpoint.

If the return temperature lies in zone B (figure 1.11c), the power of the compressor is modulated according to system requirements.

Figure 1.11 a)

Figure 1.11 b)

Figure 1.11 c)

Suppose we have a unit with more than one compressor.

Figure 1.12: Adjustment for a twin-compressor unit. *Min*=theoretical minimum electrical power absorbed by a compressor, *Max*=theoretical maximum electrical power absorbed by a compressor.

Let us take a close look at how the compressor is activated.

The amplitude of zone A coincides with the temperature difference at the evaporator, with all the compressors running at minimum power.

Zone A is the sum of the zones of each single compressor ($A_1 + A_2 + \dots$).

When the temperature lies in one of the A_n zones, the power of the active compressors is modulated according to system requirements.

When moving from an A_n zone to the one just above it, the active compressors are taken to minimum power while waiting for the next one to be switched on. After that, they continue to be modulated in the new zone.

When moving from an A_n zone to the one just below it, one of the compressors is switched off while the others are kept at a minimum.

Figure 1.13: *adjustment for a twin-compressor unit*

The following figure, instead, gives an example of the integral contribution of the adjustment method.

Figure 1.14: Adjustment for a single-compressor unit: integral contribution

2 ALARMS

Press the [ALARM] key once to enter the "alarms menu" and view the alarm message along with its code. If there is more than one alarm, scroll the menu using the [UP] and [DOWN] keys.

In the W3000 base, "NO A" is displayed if there is no alarm, otherwise the alarm code appears.

Press any other key to exit from this menu.

To reset the alarm press the [ALARM] key again and hold it down until the message "No Alarm Active" (for W3000 or W3000 compact) or "No A" (for W3000 base) appears. If the message does not appear it means that one or more alarm conditions are still active.

Alarms table

| ALARM | DESCRIPTION | details | RESET |
|-------|---------------------------------------|--|-------|
| 002 | Phase sequence / Voltage out of range | Faulty phase connection. Totally shuts down the unit (only displayed if the input that detects it is fitted) | A |
| 003 | Evaporator flow switch | No flow to evaporator. The alarms automatically resets 3 times in the same hour if flow is restored within the maximum operating time of the pumps with a small amount of water (P23.34), otherwise, it must be reset manually | A/M |
| 005 | Low inlet temperature | Enabled only in the "heat pump" mode. Low water temperature at evaporator inlet. | S-A |
| 006 | High inlet temperature | Enabled only in the "chiller" mode. High water temperature at evaporator inlet. | S-A |
| 010 | Evaporator antifreeze | Low water temperature at evaporator outlet. Also specifies (except for W3000 base) which evaporator (if more than one) is involved in the alarm condition. | M |
| 014 | Insufficient system pressure | Only displayed if the relative input is present (see I/O menu). Unit stops due to an external pressure switch. | M |
| 017 | Low external air temperature | Indicates that the external air temperature has fallen below the set point. | S |
| 021 | Low water charge | The evaporator inlet temperature changes too quickly and creates a low water level in the system. | S |
| 022 | Low water flow | The temperature difference between the evaporator inlet and outlet is too high and creates a low water flow from the pump | M |
| 045 | Condenser flow switch | Similarly to "Evaporator flow switch" (only for water/water units with freon reversal). | A/M |
| 046 | Recuperator flow switch | No water flow to the recuperator. | A |
| 051 | Pump 1 maintenance | Maintenance hours limit exceeded (in units with just 1 pump, pump 1 is the evaporator pump) | S |
| 052 | Pump 2 maintenance | Pump 2 maintenance hours limit exceeded (in units with more than one pump). | S |
| 061 | Subcooling driver 1 offline | The circuit 1 subcooling management driver is disconnected (only for units with centrifuge compressors) | A |
| 062 | Subcooling driver 2 offline | "as above, for circuit 2" | A |
| 063 | Subcooling driver 3 offline | "as above, for circuit 3" | A |
| 064 | Subcooling driver 4 offline | "as above, for circuit 4" | A |
| 075 | Condenser antifreeze | Low water temperature at condenser outlet. Except for W3000 base, it also specifies which condenser (if more than one) is involved in the alarm condition (only for water/water units with freon reversal). | M |
| 076 | Recuperator antifreeze | Low water temperature at recuperator outlet. | A |
| 081 | Pump 1 thermal switch | Pump 1 overheated (in units with just 1 pump, pump 1 = evaporator pump) | M |

| ALARM | DESCRIPTION | details | RESET |
|-------|--------------------------------------|---|---------|
| 082 | Pump 2 thermal switch | Pump 2 overheated (in units with more than one pump). | M |
| 085 | Condenser pump thermal switch | Condenser pump overheated (only for water/water units with freon reversal) | M |
| 086 | Recuperator pump thermal protection | Recuperator pump overheated | M |
| 087 | Glycol pump thermal switch | Glycol pump overheated (in units with freecooling). | S/A |
| 090 | Slave no-link | The slave card is disconnected (only for units with 3 or 4 circuits) | A |
| 091 | Expansion 1 no-link | Master expansion 1 unlinked. Apart from W3000 base, the word master appears in units with 3 or 4 circuits. | A |
| 092 | Expansion 2 no-link | "as above, for expansion 2" | A |
| 093 | Expansion 3 no-link | "as above, for expansion 3" | A |
| 094 | Expansion 4 no-link | "as above, for expansion 4" | A |
| 095 | Expansion 5 no-link | "as above, for expansion 5" | A |
| 101 | Expansion 1 slave no-link | Slave expansion 1 unlinked. | A |
| 102 | Expansion 2 slave no-link | "as above, for expansion 2" | A |
| 103 | Expansion 3 slave no-link | "as above, for expansion 3" | A |
| 104 | Expansion 4 slave no-link | "as above, for expansion 4" | A |
| 105 | Expansion 5 slave no-link | "as above, for expansion 5" | A |
| 111 | Compressor 1 oil | No oil on compressor 1 due to low compressor oil level or pressure | M |
| 112 | Compressor 2 oil | "as above, for compressor 2" | M |
| 113 | Compressor 3 oil | "as above, for compressor 3" | M |
| 114 | Compressor 4 oil | "as above, for compressor 4" | M |
| 121 | High outlet temperature compressor 1 | Compressor 1 delivery temperature is higher than the set limit. | M |
| 122 | High outlet temperature compressor 2 | "as above, for compressor 2" | M |
| 123 | High outlet temperature compressor 3 | "as above, for compressor 3" | M |
| 124 | High outlet temperature compressor 4 | "as above, for compressor 4" | M |
| 131 | Compressor 1 fault | Compressor 1 motor overheated or any another fault | M - A/M |
| 132 | Compressor 2 fault | "as above, for compressor 2" | M - A/M |
| 133 | Compressor 3 fault | "as above, for compressor 3" | M - A/M |
| 134 | Compressor 4 fault | "as above, for compressor 4" | M - A/M |
| 141 | Compressor 1 offline | No communication with compressor n°1 (only for units with centrifuge compressors) | A |
| 142 | Compressor 2 offline | "as above, for compressor 2" | A |
| 143 | Compressor 3 offline | "as above, for compressor 3" | A |
| 144 | Compressor 4 offline | "as above, for compressor 4" | A |
| 151 | Compressor 1 maintenance | Maintenance hours limit exceeded on compressor 1 | S |
| 152 | Compressor 2 maintenance | "as above, for compressor 2" | S |
| 153 | Compressor 3 maintenance | "as above, for compressor 3" | S |
| 154 | Compressor 4 maintenance | "as above, for compressor 4" | S |
| 171 | Compressor 1 start-up timeout | Compressor 1 did not start within the set timeout (only for units with centrifuge compressors) | A/M |
| 172 | Compressor 2 start-up timeout | "as above, for compressor 2" | A/M |
| 173 | Compressor 3 start-up timeout | "as above, for compressor 3" | A/M |
| 174 | Compressor 4 start-up timeout | "as above, for compressor 4" | A/M |
| 181 | Compressor 1 start-up limit | The maximum number of start-ups per hour permitted for compressor 1 has been exceeded (only for quick mind adjustment and modulating adjustment of screw compressors) | S |
| 182 | Compressor 2 start-up limit | "as above, for compressor 2" | S |
| 183 | Compressor 3 start-up limit | "as above, for compressor 3" | S |
| 184 | Compressor 4 start-up limit | "as above, for compressor 4" | S |
| 211 | Circuit 1 high pressure | High pressure on cooling circuit 1 | M |
| 212 | Circuit 2 high pressure | "as above, for circuit 2" | M |
| 213 | Circuit 3 high pressure | "as above, for circuit 3" | M |
| 214 | Circuit 4 high pressure | "as above, for circuit 4" | M |
| 221 | Circuit 1 fan thermal protection | One of the condensation fans in circuit 1 overheated and stopped. | M |
| 222 | Circuit 2 fan thermal protection | "as above, for circuit 2" | M |

| ALARM | DESCRIPTION | details | RESET |
|-------|---|---|-------|
| 223 | Circuit 3 fan thermal protection | "as above, for circuit 3" | M |
| 224 | Circuit 4 fan thermal protection | "as above, for circuit 4" | M |
| 231 | Circuit 1 low pressure | Low pressure detected by the transducer/pressure switch on circuit 1 | A/M |
| 232 | Circuit 2 low pressure | "as above, for circuit 2" | A/M |
| 233 | Circuit 3 low pressure | "as above, for circuit 3" | A/M |
| 234 | Circuit 4 low pressure | "as above, for circuit 4" | A/M |
| 241 | Transducer 1 high pressure | High pressure detected by the transducer/pressure switch on cooling circuit 1 | M |
| 242 | Transducer 2 high pressure | "as above, for circuit 2" | M |
| 243 | Transducer 3 high pressure | "as above, for circuit 3" | M |
| 244 | Transducer 4 high pressure | "as above, for circuit 4" | M |
| 251 | Circuit 1 start-up timeout | Possible start-up attempt with no Freon in circuit 1. | A |
| 252 | Circuit 2 start-up timeout | "as above, for circuit 2" | A |
| 253 | Circuit 3 start-up timeout | "as above, for circuit 3" | A |
| 254 | Circuit 4 start-up timeout | "as above, for circuit 4" | A |
| 261 | No freon in circuit 1 | Possible Freon leakage in circuit 1 as the "Start-up timeout" alarm has continued for at least 8 hours. | A |
| 262 | No freon in circuit 2 | "as above, for circuit 2" | A |
| 263 | No freon in circuit 3 | "as above, for circuit 3" | A |
| 264 | No freon in circuit 4 | "as above, for circuit 4" | A |
| 271 | Finned coil in circuit 1 | Circuit 1 condensation coil obstructed | A/M |
| 272 | Finned coil in circuit 2 | "as above, for circuit 2" | A/M |
| 273 | Finned coil in circuit 3 | "as above, for circuit 3" | A/M |
| 274 | Finned coil in circuit 4 | "as above, for circuit 4" | A/M |
| 281 | Insufficient evaporation pressure circuit 1 | There may not be any freon in circuit 1 as the evaporation pressure has fallen below the set point | M |
| 282 | Insufficient evaporation pressure circuit 2 | "as above, for circuit 2" | M |
| 283 | Insufficient evaporation pressure circuit 3 | "as above, for circuit 3" | M |
| 284 | Insufficient evaporation pressure circuit 4 | "as above, for circuit 4" | M |
| 301 | Compressor 1 inverter temperature | Compressor 1 inverter overheated | A/M |
| 302 | Compressor 2 inverter temperature | "as above, for compressor 2" | A/M |
| 303 | Compressor 3 inverter temperature | "as above, for compressor 3" | A/M |
| 304 | Compressor 4 inverter temperature | "as above, for compressor 4" | A/M |
| 311 | Compressor 1 discharge temperature | Compressor 1 discharge overtemperature (only for units with centrifuge compressors) | A/M |
| 312 | Compressor 2 discharge temperature | "as above, for compressor 2" | A/M |
| 313 | Compressor 3 discharge temperature | "as above, for compressor 3" | A/M |
| 314 | Compressor 4 discharge temperature | "as above, for compressor 4" | A/M |
| 321 | Compressor 1 low pressure | Compressor 1 suction pressure under min. (only for units with centrifuge compressors) | A/M |
| 322 | Compressor 2 low pressure | "as above, for compressor 2" | A/M |
| 323 | Compressor 3 low pressure | "as above, for compressor 3" | A/M |
| 324 | Compressor 4 low pressure | "as above, for compressor 4" | A/M |
| 331 | Compressor 1 high pressure | Compressor 1 compression pressure over max. (only for units with centrifuge compressors) | B |
| 332 | Compressor 2 high pressure | "as above, for compressor 2" | B |
| 333 | Compressor 3 high pressure | "as above, for compressor 3" | B |
| 334 | Compressor 4 high pressure | "as above, for compressor 4" | B |
| 341 | Compressor 1 input current | Compressor 1 current input over max. (only for units with centrifuge compressors) | B |
| 342 | Compressor 2 input current | "as above, for compressor 2" | B |
| 343 | Compressor 3 input current | "as above, for compressor 3" | B |
| 344 | Compressor 4 input current | "as above, for compressor 4" | B |
| 351 | Compressor 1 rotor temperature | Compressor 1 rotor temperature over max. (only for units with centrifuge compressors) | A/M |
| 352 | Compressor 2 rotor temperature | "as above, for compressor 2" | A/M |
| 353 | Compressor 3 rotor temperature | "as above, for compressor 3" | A/M |
| 354 | Compressor 4 rotor temperature | "as above, for compressor 4" | A/M |
| 361 | Compressor 1 compression ratio | Compressor 1 compression ratio over max. (only for units with centrifuge compressors) | A/M |
| 362 | Compressor 2 compression ratio | "as above, for compressor 2" | A/M |

| ALARM | DESCRIPTION | details | RESET |
|-------|--------------------------------|---|-------|
| 363 | Compressor 3 compression ratio | "as above, for compressor 3" | A/M |
| 364 | Compressor 4 compression ratio | "as above, for compressor 4" | A/M |
| 371 | Compressor 1 bearings | Compressor 1 bearings faulty (only for units with centrifuge compressors) | A/M |
| 372 | Compressor 2 bearings | "as above, for compressor 2" | A/M |
| 373 | Compressor 3 bearings | "as above, for compressor 3" | A/M |
| 374 | Compressor 4 bearings | "as above, for compressor 4" | A/M |
| 381 | Compressor 1 SCR temperature | Compressor 1 SCR temperature over max. (only for units with centrifuge compressors) | A/M |
| 382 | Compressor 2 SCR temperature | "as above, for compressor 2" | A/M |
| 383 | Compressor 3 SCR temperature | "as above, for compressor 3" | A/M |

| 644 | High pressure in circuit 4 pre-alarm | "as above, for circuit 4" | S |

Key to "RESET" column:

- M = Manual reset alarm (if the condition that generated the alarm is eliminated, the alarm must be reset from the keypad); sets "cumulative alarms"
- A = Automatic reset alarm (if the condition that generated the alarm is eliminated, the alarm is reset automatically); sets "cumulative alarms"
- A/M = Automatic reset alarm for the first "n" cut-ins, after which manual; sets "cumulative alarms"
- S = Signal on display (does not set "cumulative alarms")
- S-A = Automatic reset signal (that does not stop the machine) or alarm. The mode is selected from a parameter
- M - A/M = Manual reset alarm (in hermetic, alternative and screw compressors), automatic for the first "n" cut-ins, after which manual (in centrifuge compressors)
- B = Block that cannot be reset from the display; sets "cumulative alarms". To eliminate the alarm, switch the relative compressor off and then back on again.

3 TABLE OF MASKS

Press [UP] or [DOWN] to move from one mask to another inside the same menu.

Press [ENTER] to access the parameter, press [UP] or [DOWN] to change the value of the parameter.

| Mask | Description | Para n° |
|--|--|-------------------------|
| Com. : ON ALXXX Mode : chiller State: ON keypad LIMIT ID:011 U:01 | Main display mask. Shows operating mode and status. The unit can be switched on and off with the On/Off command: press "Enter" to move to "Com. :", select the command using the "Up" or "Down" keys and press "Enter" again to confirm. Also displays the following messages: "ALxxx": alarm active, "Sxxx": signal active, "U:xx" : unit configuration address, "ID:xxx" : unit supervisor address, Symbols describing unit status also appear (see table at the end of this manual). | |
| Term. Req. Act. Cool. 042 050 % Rec. 040 050 % Pump time 010s | Shows the request of the controller and the operating percentage of the thermoregulator (cool/heat) and recovery (if possible). Also shows the pump time remaining during switching on and off. | |
| Temp. In. Out. Evap. 12.5 07.0°C Rec. 35.6 40.5°C Cond. 38.0 42.5°C | Shows the inlet and outlet water temperature. (evaporator, recuperator and condenser are only displayed if they are fitted). | |
| Temp. In. Out. Evap. 12.5 07.0°C Evap1 07.2°C Evap2 06.9°C | (if 2 evaporators are fitted) Displays inlet and outlet temperatures of the evaporator or condenser (depending on whether the unit is in the chiller or heat pump mode) and the outlet temperature of the two evaporators. | |
| Temp. In. Out. Cond. 24.3 22.4°C Cond.1 22.3°C Cond.2 22.4°C | (if 2 condensers are fitted) Displays inlet and outlet temperatures of the evaporator or condenser (depending on whether the unit is in the chiller or heat pump mode) and the outlet temperature of the two condensers. | |
| Temp. Freecooling 12.3°C External air 15.4°C Optional 19.6°C | (for water-air units) Displays freecooling temperature (in chiller+freecooling units), external air temperature and optional temperature (if the probes are enabled). | |
| Manuf. Password:0000000000 | Access mask to manufacturer menu. Enter the manufacturer password for access. This menu may only be accessed by authorised staff. | |
| Config. ← ↓ | Access mask to user configuration submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Unit: Type : chiller Compressors : Type : hermetic | Mask for setting the type of unit and compressors. | 01.01 01.02 |
| Circuits: N° : 2 | Sets the number of circuits in the unit | 01.03 |
| N° compressors per circuit : 1 N° sep. stages per compressor : 0 | Sets the number of compressors per circuit and the number of separation stages per compressor. | 01.04 01.05 |
| Condensation: Type : water N° : 2 Reversal : water | Sets the type of condensation (for evaporating units set none). For water-cooled units with Freon-side reversal, select the number of condensers in the unit. For water-cooled heat pumps set the type of circuit reversal (water-side or freon-side reversal). | 01.06 01.07 01.08 |
| Fan: Type : axial | Selects the type of ventilation used, only for air-cooled units. | 01.09 |
| Evaporation: Type : water N° : 1 | Selects the type of evaporation and the number of evaporators in the unit. (For evaporating units set the number of evaporators to 0) | 01.10 01.11 |
| Evaporating banks: N° : 1 | Sets the number of evaporating banks, only for evaporating units. | 01.12 |

| Mask | Description | Para n° |
|---|--|----------------------------------|
| Refrigerant: Type : R407c | Sets the type of refrigerant used. | 01.13 |
| Recovery: Enabled: N | Enables recovery. Recovery is enabled automatically in the polyvalent units. | 01.14 |
| Freecooling: Enabled: N | Enables freecooling control. | 01.15 |
| Enable probes: External temp. N Optional temp. N | Probe enable mask for enabling the external air temperature probe or optional temperature probe (only visible in water-air units) | 01.17 01.24 |
| Enable probes: Cond. in. temp. N Cond. out. temp. N | Probe enable mask for enabling the condenser inlet probe or the condenser outlet probe (only visible in water-water chiller and heat pump units with just one condenser; two condenser outlet probes are enabled in the units with two condensers) | 01.16 01.25 |
| Enable probes: Pressure N Low Pressure N | Maschera di abilitazione sonde per l'abilitazione dei trasduttori di alta pressione e di bassa pressione. | 01.18 01.19 |
| High pressure transducers Start Scale 00.0bar End Scale 30.0bar | Mask for configuring the high pressure transducers. | 01.20 01.21 |
| High pressure transducers Start Scale 00.0bar End Scale 30.0bar | Mask for configuring the low pressure transducers. | 01.22 01.23 |
| Global. ← ↓ | Access mask to user global parameters submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Enter another manufacturer password 0000000000 | Sets a new password. ATTENTION: THE PASSWORD ENTERED IN THIS FIELD IS THE ONLY ONE THAT ALLOWS ACCESS TO THE MANUFACTURER MENU!! | |
| Display passwords service 0000 user 0000 | Displays the passwords governing access to the service and user menus | |
| W 3000 Code CA 15.00 GB  Man. C0240011-06-07 | This mask contains the reference information of the software [Code] and of the reference technical manual [Man]. The closed padlock symbol shows that the board is provided with its propriety software; two padlocks appear on units with 3 or 4 circuits | |
| Functions ← ↓ | Access mask to functions submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Setpoint Limitation Winter N | Enables setpoint limitation in summer and winter modes. | 05.02 |
| Ext. air winter set point limit. -05.0°C Delta 05.0°C Max var. set 05.0°C | (only with winter setpoint limitation) Enables setting of the external air temperature setpoint below which setpoint limitation begins in the heat pump or recovery only modes and defining the temperature delta at which the maximum setpoint (lowering) variation (negative) takes place. | 05.07 05.08 05.09 |
| Max setpoint limit winter 45.0°C | (only with winter setpoint limitation) maximum winter setpoint limit | 05.10 |
| Coil fractioning N | Enables coil fractioning. | 05.11 |
| Upper set 10.0 bar Upper diff. 05.0 bar Lower set 12.0 bar Lower diff. 00.5 bar | (only with coil fractioning) Sets the upper setpoint and differential and the lower setpoint and differential for controlling coil fractioning. | 05.12 05.13 05.14 05.15 |
| Subcooling modulating adjustment Enable N | Enables subcooling modulating adjustment (only for units with centrifuge compressors) | 05.30 |

| Mask | Description | Para n° |
|---|---|-------------------------|
| Subcooling Enabled N | Enables subcooling. This function is only enabled in chillers with recovery mode. | 05.16 |
| Subcooling Adjustment start delay 010 s Relay delay 005 s | Sets the delay before subcooling adjustment commences and the delay in the subcooling relay. | 05.17 05.18 |
| Subcooling Upper set 06.0 °C Lower set 04.0 °C | Sets the upper and lower sub cooling setpoint. | 05.19 05.20 |
| High temp. pressure switch control Enabled: N | Enables setting of the pressure switch control of high temperatures by separating active circuit power | 05.21 |
| High temp. pressure switch control Setpoint: 23.5 bar Diff: 02.0 bar | Enables the setpoint and differential for the pressure switch control of high temperatures | 05.22 05.23 |
| Pumpdown Disabled | Enables or disables pumpdown. Selects the type of pumpdown to perform, pumpdown during shutdown or cyclical pumpdown or both. | 05.24 |
| Pumpdown Setpoint 02.5bar Max. time 03s | Sets end pumpdown setpoint and pumpdown timeout. The pumpdown procedure is interrupted ... - when low pressure falls below the setpoint (if there are transducers on the low pressure section) - when the low pressure switch trips (if there are no transducers) - after the timeout (if the procedure is not interrupted by pressure) | 05.25 05.26 |
| Cyclical pumpdown Cycle time 030min | Sets the cyclical pumpdown time. A pumpdown is performed each time the set time elapses. The time is reset every time a mode change occurs. | 05.27 |
| Pumpdown Chiller S Heatpump N Ch+Rec N Win rec N Sum rec N => 01 | Sets the modes in which pumpdown is performed (both cyclical and shutdown). Depending on the type of unit, a smaller or larger number of available modes appear. Pumpdown can be selected in the chiller mode and not in the chiller plus recovery mode, for example. | 05.28 |
| All-in-one unit valve override Enabled: Y | Sets valve override for all-in-one units. | 05.29 |
| Compressor ← ↓ | Access mask to compressor submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Min compressor stop time 0120 s | Minimum time a compressor must stay off after being switched off. (Only visible in the proportional step adjustment mode) | 09.02 |
| Min. del. btw starts diff. compr. 0010 s Min. del. btw starts same compr. 0360 s | "Antipeak" time to prevent overcurrents at start-up due to simultaneous demand from more than one compressor. Delay which limits the number of compressor start-ups per hour. (Only visible in the proportional step adjustment mode) | 09.03 09.04 |
| Max. compr. starts per hour 10 Min. compr. start time 150 s | Maximum permitted number of compressor starts per hour. Minimum switch-on time of a compressor. (Only visible in the quick mind and modulating adjustment modes of screw compressors) | 09.05 09.06 |
| Force at low ext.t. Enable N Setpoint -05.0 °C Diff. 01.0 °C | Only for screw compressors. Enables 100% screw compressor forcing of in the winter mode with low external temperatures. | 09.07 09.08 09.09 |
| Oil control type Direct Max time : 1200s Override T: 120s | Selects the screw compressor oil level control mode: None, Direct, Indirect and Direct + Indirect. | 09.58 09.11 09.12 |
| Width of dead area: 015 % | Sets the percentage with respect to the dead area and around the setpoint in which the compressor is not modulated. (only for modulating screw compressors) | 09.59 |
| Power incr. impulse: Period: 010 s Min. dur.: 00.3 s Max. dur.: 02.0 s | Sets the period and duration of the power increase impulse. (Only for modulating adjustment of screw compressors) | 09.14 09.15 09.16 |
| Power decr. impulse: Period: 010 s Min. dur.: 00.5 s Max. dur.: 03.0 s | Sets the period and duration of the power decrease impulse. (Only for modulating adjustment of screw compressors) | 09.17 09.18 09.19 |

| Mask | Description | Para n° |
|---|--|----------------------------------|
| Compressor start time: 30 s | Sets the start-up time of the compressor, that, is, the time the compressor remains in the no-load start mode before it starts adjusting. (Only for modulating adjustment of screw compressors) | 09.20 |
| Min. time sep. stages active: 10 s | Sets the minimum time the separation stages remain active. | 09.21 |
| Time compressor oil valve active 10 s | Sets the time the compressor oil valve remains active. | 09.22 |
| Model: Bitzer | Sets the compressor model. | 09.23 |
| Economiser: Enable N Start delay 120 s | Enables the economiser and sets the start delay. | 09.24 09.25 |
| Economiser disable: Setpoint 15.0 bar Diff. 2.0 bar | Sets the setpoint and differential for disabling the economiser. | 09.26 09.27 |
| Compressor discharge temperature control Enabled: N | Enables compressor discharge temperature control for liquid injection. | 09.28 |
| Compressor discharge temperature control Setpoint 110.0 °C Diff. 10.0 °C | Sets the setpoint and differential for liquid injection. | 09.29 09.30 |
| Config. discharge temperature probes for compressors: NTC 0-150°C | Mask only visible in screw compressors that allow the type of discharge temperature probe used to be selected. | 09.60 |
| Compressor modulation Minimum: 010 % Maximum: 090 % | Sets minimum and maximum values for centrifugal compressor modulation. | 09.31 09.32 |
| Start revs: 03300 rpm Compressor start time: 020 s | Sets the number of revs for calculating opening of the liquid line solenoid valve. Sets minimum revs timeout during start-up. (Only for centrifuge compressors) | 09.33 09.34 |
| Number of bypass valves 1 | Sets the number of bypass valves (N.B.: controlled by the board and not by external timers) (Only for centrifuge compressors) | 09.35 |
| Start compression 2.2 Start bypass delay 020 s | Sets the compression ratio for calculating opening of the liquid line solenoid valve. Sets the bypass solenoid valve closing delay. (Only for centrifuge compressors) | 09.36 09.37 |
| Power request increase Integral T. 005 sec Minimum Var. 001 % | Sets the integral time and minimum variation for increasing the power request. (Only for centrifuge compressors) | 09.38 09.39 |
| Power request decrease Integral T. 005 sec Minimum Var. 001 % | Sets the integral time and minimum variation for decreasing the power request. (Only for centrifuge compressors) | 09.40 09.41 |
| Centrifuge Comp. off: on: Comp. 1 000% 040% Comp. 2 000% 040% | Sets the enable and disable percentage with respect to the proportional band for each centrifuge compressor. | 09.42 09.43 09.44 09.45 |
| Centrifuge Comp. off: on: Comp. 3 000% 040% Comp. 4 000% 040% | Sets the enable and disable percentage with respect to the proportional band for each centrifuge compressor. | 09.46 09.47 09.48 09.49 |
| Valves ← ↓ | Access mask to valves submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Status configuration S0 => off Valves: CCCCCCCC => 00 | Status editor mask. Configures the valves (A=valve open, C=valve closed) in each status (S0,S1,... S12). Valve configuration is automatically converted. It is also possible to directly set the coded information, the state of the valves is automatically decoded and memorised. | |

| Mask | Description | Para n° |
|--|---|-------------------------|
| Status Code | Description | 13.01 |
| S0 off | Off, circuit off | 13.02 |
| S1 chiller on | Chiller on | 13.03 |
| S2 ch+rec on | Chiller plus recovery on | 13.04 |
| S3 chiller pd | Chiller in pumpdown | 13.05 |
| S4 chiller off | Chiller off | 13.06 |
| S5 rec on | Recovery on | 13.07 |
| S6 defrost | Defrost | 13.08 |
| S7 rec pd | Recovery in pumpdown | 13.09 |
| S8 rec off | Recovery off | 13.10 |
| S9 heatpump on | Heat pump on | 13.11 |
| S10 ch+rec pd | Chiller plus recovery in pumpdown | 13.12 |
| S11 heatpump pd | Heat pump in pumpdown | 13.13 |
| S12 heatpump off | Heat pump off | |
| Valve release time: V1: 000 s | Sets the valve release time. | 13.14 |
| V2: 000 s V3: 000 s | | 13.15 |
| V4: 000 s V5: 000 s | | 13.16 |
| | | 13.17 |
| | | 13.18 |
| Valve release time : V6: 000 s | Sets the valve release time. | 13.19 |
| V7: 000 s V8: 000 s | | 13.20 |
| V9: 000 s V10:000 s | | 13.21 |
| | | 13.22 |
| | | 13.23 |
| C1: off valve:CCCCCCCCC C2: off valve:CCCCCCCCC | Displays the status of the circuits and circuit valves. | |
| C3: off valve:CCCCCCCCC C4: off valve:CCCCCCCCC | Displays the status of the circuits and circuit valves. | |
| Defrost ← ↓ | Access mask to defrost submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Defrost config. Timer + Auto Tuning | Sets 3 defrost types: Traditional, defrosting at fixed intervals, Timer Tuning, defrosting at dynamic intervals, Timer Tuning + Auto Tuning, defrosting at dynamic intervals, also analysing evaporation pressure values. | 21.01 |
| Defrost parameters: Start 03.0 bar Stop 14.0 bar | Defines the pressure setpoints for start and stop defrost. | 21.02 21.03 |
| Defrost parameters: Delay 01800 s Max. time 00300 s Drip time 120 s | Sets defrost time parameters. Delay: cumulative time measured before the defrost procedure starts. Max. time: maximum duration of defrost procedure. Drip time: duration of coil dripping | 21.04 21.05 21.06 |
| Timer tuning defrost Ref. time 120 s Ref. T. -10°C 180 s Ref. T. +10°C 060 s | Sets certain timer tuning defrost parameters. Nominal defrost reference time (display only). Reference time at -10°C used to calculate the nominal reference time. Reference time at +10°C used to calculate the nominal reference time. | 21.08 21.07 |
| Timer tuning maximum delay variation perc. 20 % | Sets the maximum current defrost delay variation percentage. | 21.09 |
| Maximum defrosts per hour 3 | Sets the maximum number of defrosts in an hour. If this value is exceeded, the finned coil alarm appears. | 21.10 |
| Ext t.-Evap. t. calc. interval 300 s t.ext-t.evap. var. speed threshold 3.0°C | (only for auto tuning) Maximum rate of change in the difference between external temperature and evaporation temperature. If exceeded, it force activates the defrost procedure after the bypass time. The calculation is updated every "calculation interval" | 21.11 21.12 |
| Ext t.-evap. t. difference threshold for changing defrost delay 15.0°C | (only for auto tuning) Initial threshold for the difference between external temperature and evaporation temperature for changing the defrost start delay. | 21.13 |
| Threshold offset Start var. 2.0°C Variation factor 1 % | (only for auto tuning) Offset used to calculate the threshold for changing the defrost start delay. Defrost start delay change factor provided by Auto Tuning Defrost. | 21.14 21.15 |

| Mask | Description | Para n° |
|--|--|-------------------------|
| Circuit start bypass 120 s Start variation delay 600 s | (only for auto tuning) Bypass delay between the start of the circuits and the moment the defrost procedure is forced if the maximum speed of change in the difference between the external temperature and the evaporation temperature is exceeded. If the difference between the external temperature and the evaporation temperature is greater than the calculated threshold, when the "Variation start delay" elapses, the defrost start delay specified in the "Change factor" parameter commences. | 21.16 21.17 |
| Minimum derived evaporation pressure -00.1 bar/m | (only for auto tuning) Maximum permitted change in evaporation pressure before changing the defrost start delay. | 21.18 |
| Forced defrosting with low pressure Enabled Y Threshold 1.7 bar | Minimum permitted evaporation pressure in heatpump. If the pressure falls below this value, defrosting is forced. | 21.19 21.20 |
| Step override in heatpump separate 1.7 bar restore 2.1 bar | Evaporation pressure values at which the circuit with more than one hermetic compressor per circuit is "separated" to return the operating point within limits. Evaporation pressure value at which compressor "separation" terminates. | 21.21 21.22 |
| Enable Free Defrost Y Minimum external temperature 04.0°C | Enables the Free-Defrost algorithm and sets the minimum external temperature for operation. | 21.23 21.24 |
| Drip phase with compressors on N | Enables the drip phase with the compressors on after defrosting. | 21.25 |
| Recovery ← ↓ | Access mask to recovery submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Chiller override fm recovery pressure Setpoint 23.5 bar Diff. 5.0 bar | Defines the pressure setpoint and differential at which the recovery mode is forced to chiller. | 15.03 15.04 |
| Cyclical override to chiller from ch+rec Enable N Cycle time 060min | Enables override to the chiller mode from the chiller plus recovery mode (only for units with recovery). Sets the cycle time of this function, that is, the maximum time in the chiller plus recovery mode. The time is reset every time a mode change occurs. (NB.: pumpdown is also considered a mode change and therefore the cyclical pumpdown function in the Ch+rec mode is inconsistent with cyclical override, the function will be performed with the lowest cycle time.) | 15.05 15.06 |
| Override time in chiller before passing to ch+rec 120 s | Changing mode to Chiller+Rec. On, requires the Chiller On mode. This mask sets the Chiller On mode timeout before passing to the Chiller+Rec On mode. | 15.07 |
| Condens. ← ↓ | Access mask to condensation submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Condensation control Enable : Y Type : Step Cont. N° steps : 3 | Enables condensation control, the type and number of steps. | 17.01 17.02 17.03 |
| Condensation control Type: Separate Mod.: PWM | Selects between individual and contemporary condensation. Also sets linear fan operation (0:Standard - 1:0-10V - 2:PWM - 3:FAE - 4:0-10V C5110973) | 17.04 17.05 |
| Condensation control Logic: direct | Selects the type of valve for condensation in water-cooled chillers. | 17.06 |
| Enable max. override Chiller cond. NO Setpoint 23.0 bar Diff. 3.0 bar | Enables 100% forced condensation in the chiller mode and establishes the setpoint. | 17.10 17.11 17.12 |
| Enable max. override Heat pump evap. NO Setpoint 01.0 bar Diff. 0.5 bar | Used to enable 100% forced evaporation in the heat pump mode and establish the setpoint. | 17.13 17.14 17.15 |
| Cont. cond. control Chiller Setpoint 14.0 bar Diff. 05.0 bar | Sets the setpoint and differential for continuous condensation adjustment in the chiller mode. | 17.32 17.33 |
| Cont. cond. control HeatPump Setpoint 06.0 bar Diff. 01.0 bar | Sets the setpoint and differential for continuous condensation adjustment in the heat pump mode. | 17.34 17.35 |

| Mask | Description | Para n° |
|--|--|----------------|
| Cont. condensation control Max. lim. 100 % Min. lim. 030 % | Sets maximum and minimum condensation with continuous adjustment. This is fan speed or condensation valve opening. | 17.36 17.37 |
| Cont. condensation control Min. lim. Adjustment off: Y Diff. 01.0bar | Enables the fans or the condensation valve when the minimum condensation limit is reached with continuous adjustment. The set condensation minimum may remain enabled or adjustment can be turned off when pressure falls below the condensation setpoint of the differential value. | 17.38 17.39 |
| Modulating valve management N Opening time 100% 070 s | Enables management of the 2- or 3-way modulating valve connected to the heat exchanger with well/tower water and sets opening time from 0% to 100%. | 17.40 17.41 |
| Alarms ← ↓ | Access mask to alarms submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| High pressure from transducers alarm: Setpoint 28.0 bar Diff. 07.0 bar | Sets the setpoint and differential for activating the high pressure from transducers alarm. | 23.01 23.02 |
| Low press. alarm N° resets 3 Start bypass 120 s | Sets the parameters for activating the low pressure alarm. Number of times the alarm has triggered in the previous hour and been reset automatically within the set period, the next time the alarm triggers it must be reset manually. Low pressure alarm by-pass delay. | 23.03 23.04 |
| Low pressure alarm from transducers: Setpoint 01.6 bar Diff. 00.9 bar | Sets the setpoint and differential for activating and resetting the low pressure alarms (only if the low pressure transducers are configured) | 23.05 23.06 |
| Low pressure alarm low air temp. Enabled N Start timeout 120 s | Enables external air temperature control for activating the low pressure alarm and sets the start timeout. | 23.07 23.08 |
| Low pressure alarm low air temp. Setpoint 0.1 bar Diff. 0.5 bar | Sets the setpoint and differential for activating and resetting the low pressure alarms with control on external air temperature | 23.09 23.10 |
| Compressor alarms N° resets 3 | Sets the maximum number of automatic reset compressor fault alarms in the arc of an hour, after which the compressor fault alarm must be reset manually. (only for centrifugal compressors) | 23.11 |
| Compressor thermal protection alarm: Bypass time 0010 s | The compressor is switched off for a set time when the unit is powered. Must be set to 360 secs only for BRISTOL compressors | 23.12 |
| Compressor discharge temperature alarm Setpoint 125.0°C Diff. 10.0°C | Sets the setpoint and differential for activating the high compressor discharge temperature alarm. | 23.13 23.14 |
| Compressor oil alarm: Start delay 090 s Running delay 090 s | Sets the compressor oil alarm delay | 23.15 23.16 |
| Flow switch alarm N° resets 3 | Sets the maximum number of automatic reset flow switch fault alarms in the arc of an hour, after which the flow switch fault alarm must be reset manually. The flow switch alarm is always automatically reset until the maximum pump alarm operation delay has elapsed. The pump then turns off and the flow switch alarm must be manually reset. | 23.25 |
| Max. pump op. and flow auto reset time in al. mode 015 s | Maximum pump operation time in flow alarm mode Following alarms requiring the pump to start (antifreeze alarm, low flow rate alarm, evaporator flow switch alarm) the pump is kept running in order to reset normal conditions. In any case, the time indicated is the time in which the flow switch alarm is automatically reset. After this delay, the flow switch alarm must be manually reset. | 23.34 |
| Evaporator flow switch alarm: Start delay 010 s Running delay 001 s | Configuration parameters for evaporator flow switch alarm. Start delay: minimum time during which the flow must remain constant before the compressors start running. Running delay: minimum time before the flow switch triggers with the compressors running. | 23.26 23.27 |
| Recuperator flow switch alarm: Start delay 010 s Running delay 001 s | Configuration parameters for recuperator flow switch alarm. Start delay: minimum time during which the flow must remain constant before the compressors start running. Running delay: minimum time before the flow switch triggers with the compressors running. | 23.28 23.29 |
| Condenser flow switch alarm: Start delay 010 s Running delay 001 s | Configuration parameters for condenser flow switch alarm. Start delay: minimum time during which the flow must remain constant before the compressors start running. Running delay: minimum time before the flow switch triggers with the compressors running. (only for water/water units with freon reversal) | 23.30 23.31 |

| Mask | Description | Para n° |
|---|--|----------------------------------|
| Low ext. air temp. Enabled N Setpoint -25.0 °C Diff. 02.0 °C | Enables external air temperature control for activating the low external air temperature alarm. Sets the alarm cut-in setpoint and differential This function automatically enables the external air temperature probe. | 35.50 35.51 35.52 |
| Default ← ↓ | Access mask to initialisation menu. Press "Up" or "Down" to scroll the other mask and "Esc" to return to the submenu. The mask is not displayed when the chiller is ON. | |
| Reset chiller to default values N | This restores the default values. Deletes the memory and installs "logical" values. The chiller must then be programmed with the parameter set during factory testing. | |
| Load configuration N | Loads parameters from file. The unit is configured with factory settings. NB: Run default before Load configuration. | |
| Alarmi log on display Delete N | Deletes the contents of the alarms log on the display | |
| Service Password: 0000 | Access mask to service menu. Enter the service password for access. This menu may only be accessed by authorised staff. | |
| Adjust. ← ↓ | Access screen to adjustment menu. Press "Up" or "Down" to scroll the other mask and "Esc" to return to the submenu. | |
| Inlet adjustment: Type PROPORTION. | Defines the type of adjustment. (only visible in the step inlet adjustment mode) | 55.01 |
| Integration time: 0090 s Integration correction limit: 020 % | Sets integration time and correction limit (displayed in the proportional step inlet adjustment mode with proportional + integral adjustment type) | 55.02 55.03 |
| Chiller setpoint limits: Low 11.0 °C High 20.0 °C | Maximum and minimum setpoint values that can be set with inlet adjustment N.B.: For low temperature units, the minimum value that can be set for the low limit is equal to the antifreeze setpoint +2°C (also check the value set for forced shut-down in the Quick Mind adjustment mode and modulating adjustment mode with screw compressors). | 55.04 55.05 55.06 |
| Chiller setpoint limits: Low 06.0 °C High 18.0 °C | Maximum and minimum setpoint values that can be set with outlet adjustment N.B.: For low temperature units, the minimum value that can be set for the low limit is equal to the antifreeze setpoint +2°C (also check the value set for forced shut-down in the Quick Mind adjustment mode and modulating adjustment mode with screw compressors). | 55.07 55.08 |
| Heat pump setpoint limits: Low 30.0 °C High 44.0 °C | Maximum and minimum setpoint values that can be set with inlet adjustment (only visible if the heat pump configuration is set) | 55.09 55.10 |
| Heat pump setpoint limits: Low 30.0 °C High 48.0 °C | Maximum and minimum setpoint values that can be set with outlet adjustment (only visible if the heat pump configuration is set) | 55.11 55.12 |
| Recovery setpoint limits: Low 30.0 °C High 45.0 °C | Maximum and minimum recovery setpoints. (only visible if recovery is configured) | 55.13 55.14 |
| Forced shutdown Chiller 04.5 °C Heat pump 51.0 °C | (Only in the Quick Mind and modulating adjustment modes of screw compressors). Forces compressor shut-down if: Tout Chiller < chiller minimum or Tout Heat Pump > heat pump maximum | 55.15 55.16 |
| Temperature adjustment band 02.5 °C Recovery adjustment band 02.5 °C | Sets the temperature and recovery adjustment band. | 55.17 55.18 |
| Dual setpoint Enable N | Enables selection of a second setpoint via an external contact (only displayed on compatible units). | 55.19 |
| Setpoint variation Enabled 4-20 mA Min. 00.0 °C Max. 06.0 °C | Enables setpoint variation through an external input which can be configured at 4-20mA or 0-5V. Maximum and minimum variation limits can also be set. If time bands have been enabled the external setpoint cannot be enabled (only displayed on compatible units). For units with alternative or screw compressors only a 4-20 mA variation can be selected. | 55.20 55.21 55.22 55.23 |

| Mask | Description | Para n° |
|---|---|----------------------------------|
| Rec. setpoint var. Enabled 4-20 mA Min. 00.0 °C Max. 06.0 °C | Enables recovery setpoint variation through an external input which can be configured at 4-20mA or 0-5V. Maximum and minimum variation limits can also be set. If time bands have been enabled the external setpoint cannot be enabled (only displayed on compatible units). For units with alternative or screw compressors only a 4-20 mA variation can be selected. | 55.24 55.25 55.26 55.27 |
| Pump config. Type of use: automatic | (Only displayed if more than one pump is set) Selects whether to use both pumps through hourly rotation (FIFO if they have the same number of operating hours) or override pump 1 or pump 2. | 55.28 |
| Minimum start delay between pump and compressors 060 s | Defines the delay between pump start-up and compressor start-up after the unit has been switched on. | 55.29 |
| Pump shutdown delay 060 s | Defines pump shutdown delay after the unit has been switched off. | 55.30 |
| Demand limit Enable N | Enables limitation of the power delivered by the unit. | 55.31 |
| Demand limit Chiller 050 % Heat pump 050 % Recovery 050 % | Sets the maximum percentage of power delivered by the unit in the chiller, heat pump (in heat pump units) and recovery (in compatible units where possible) modes. | 55.32 55.33 55.34 |
| Enable from dig. in.: On/Off: Y Chiller/HP: N | Allows the on/off status of the unit to be selected from external enables. Also performs chiller/heat pump switching in heat pump units. | 55.35 55.36 |
| Pumps ← ↓ | Access mask to pumps submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Evaporator pumps configuration: N° Pumps 1 | Sets the n° of pumps in the unit. | 07.01 |
| Enable recuperator pumps: N | Enables the pump on the recuperator. | 07.03 |
| Enable condenser pump: N | Enables the condenser pump overheated (only for water/water units with freon reversal) | 07.04 |
| Pump changeover after long activity: Threshold 0007 days Max diff. 0060 days | Defines, in the automatic mode, the number of days of continuous operation after which a pump is stopped and the other one started. Max. diff. defines the maximum difference in hours between the two pumps over which the threshold value for the pump with less hours is doubled in order to balance pump hours more rapidly. Only appears for units with two pumps. | 07.08 07.09 |
| Long inactivity: Test pumps Y Threshold 0030 days Impulse 10 s | When enabled, this function activates the pumps for the set impulse time after a period of activity reaches the threshold value. This appears with at least one pump enabled. | 07.10 07.11 07.12 |
| Freecool. ← ↓ | Access mask to freecooling submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Freecooling Delta 01.0 °C Offset -04.0 °C Diff. 01.0 °C | Sets the freecooling adjustment parameters. The delta, the offset and the differential for freecooling adjustment are set here. | 19.01 19.02 19.03 |
| Direct valve Fans hysteresis 0.3 °C delay 020 s | Selects the type of control for the freecooling valve, direct or reverse. Also sets the hysteresis of each fan and the start/stop delay for each fan. | 19.04 19.05 19.06 |
| Service ← ↓ | Access mask to assistance submenu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Hour counter Pump: Threshold 012x1000 Reset N° 000000 | Sets the threshold for programmed maintenance on the evaporator pump. | 35.01 |
| Hour counter Pump 2: Threshold 012x1000 Reset N° 000000 | Sets the threshold for programmed maintenance on pump 2. (this may be pump 2 of the evaporator or the pump on the secondary circuit in the water/water units or the recuperator pump, depending on unit configuration) | 35.02 |

| Mask | Description | Para n° |
|--|---|-------------------------|
| Hour counter Compressor 1: Threshold 010x1000 Reset N° 000000 | Sets the threshold for programmed maintenance. | 35.03 35.11 35.12 |
| Hour counter Compressor 2: Threshold 010x1000 Reset N° 000000 | Sets the threshold for programmed maintenance. | 35.04 35.13 35.14 |
| Hour counter Compressor 3: Threshold 010x1000 Reset N° 000000 | Sets the threshold for programmed maintenance. | 35.05 35.15 35.16 |
| Hour counter Compressor 4: Threshold 010x1000 Reset N° 000000 | Sets the threshold for programmed maintenance. | 35.06 35.17 35.18 |
| Priority in winter: N | Sets winter priority for recovery (only for heat pump units with recovery). | 35.27 |
| Enable remove control of recovery: N | Enables recovery control from a remote contact (requires expansion tank). | 35.28 |
| Insuff. evap. press: Enable N Start delay 300 s Full p. del. 030 s | Enables evaporation pressure control for activating the insufficient evaporation pressure alarm . Sets the alarm cut-in delay | 35.53 35.54 35.55 |
| Insuff. evap. press: Setpoint 03.4 bar Diff. 00.1 bar | Sets the setpoint and differential for activating the insufficient evaporation pressure alarm. | 35.56 35.57 |
| Evaporator antifreeze alarm: Setpoint 04.0 °C Diff. 04.0 °C | Sets the setpoint and differential for activating the evaporator anti-freeze alarm. | 35.29 35.30 |
| Evaporator antifreeze heating element: Setpoint 04.0 °C Diff. 04.0 °C | Sets the setpoint and differential for activating the evaporator anti-freeze heating element. | 35.31 35.32 |
| Condensor anti-freeze alarm: Setpoint 04.0 °C Diff. 04.0 °C | Sets the setpoint and differential for activating the condenser antifreeze alarm (only for water/water unit with freon reversal). | 35.33 35.34 |
| Recuperator anti- freeze heater: Setpoint 04.0 °C Diff. 04.0 °C | Sets the setpoint and differential for activating the recuperator anti-freeze heater. | 35.35 35.36 |
| Low water flow alarm: max. delta 08.0 °C delay 030 s | Sets the setpoint and delay for triggering the low water flow alarm. | 35.37 35.38 |
| High/Low inlet temp. to unit Type: signal Delay: 030 s | Chooses whether, with high/low inlet water temperature, the unit must continue to work (giving a signal) or stop the compressors to prevent them from suffering damage (automatic reset alarm). Sets the delay before activating the high inlet water temperature (summer mode) / low temperature inlet water (winter mode) alarm/signal. | 35.39 35.40 |
| High inlet temp. to unit signal: setpoint 30.0 °C | Sets the setpoint for activating the high inlet water temperature alarm/signal. (When operating in the chiller mode) | 35.41 |
| Low inlet temp. to unit signal: setpoint 15.0 °C | Sets the setpoint for activating the low inlet water temperature alarm/signal. (When operating in the chiller mode) | 35.42 |
| Pre-alarms Enable: N | Pre-alarm enable mask. | 35.43 |
| Antifreeze pre-alarm Offset 00.5 °C Diff. 03.0 °C | Mask for setting the offset (with respect to the antifreeze alarm) and differential of the antifreeze pre-alarm on the evaporator (only visible if pre-alarm management is enabled). The anti-freeze alarm setpoint and offset define signal activation, the differential defines deactivation. | 35.44 35.45 |
| Low pressure pre-alarm Offset 00.5 bar Diff. 00.5 bar | Mask for setting the offset (with respect to the low pressure alarm from transducer) and differential of the low pressure pre-alarm (only visible if pre-alarm management and low pressure transducers are enabled or, for heat pumps, the pressure transducers are enabled). The low pressure alarm setpoint and offset define signal activation, the differential defines deactivation. | 35.46 35.47 |

| Mask | Description | Para n° |
|---|--|-------------------------|
| High pressure pre-alarm Offset -03.5 bar Diff. 05.0 bar | Mask for setting the offset (with respect to the high pressure alarm from transducer) and differential of the high pressure pre-alarm (only visible if pre-alarm management and high pressure transducers are enabled). The anti-freeze alarm setpoint and offset define signal activation (negative offset), the differential defines deactivation (downwards with positive value). | 35.48 35.49 |

| User Password: 0000 | Access mask to user menu. Enter the user password for access. | |
| User ← ↓ | Access mask to user menu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Step adjustment type IN INLET | Chooses between proportional step adjustment, Quick Mind adjustment and modulating adjustment for screw compressors. Also defines on which temperature probe the adjustment is made. If the unit has more than one evaporator or step adjustment is set, adjustment can only be made on the inlet probe. | 39.01 39.01 39.02 |
| Time bands enable: Disabled | Activates/deactivates time bands. The time bands cannot be activated if the external setpoint is enabled. | 39.41 |
| Serial line configuration: Disabled | Allows the devices connected to the serial interface board to be enabled and selected ("0"=disabled, "1"= supervision, "2"= sequencer, "3"=Manager 3000). N.B.: the Service software does not need to be enabled. | 39.42 |
| En. from superv.: On/Off: N Operating mode: N | Allows the on/off status of the unit to be selected from a supervision system. Also performs operating mode switching (to modify the latter, the unit must be switched off). | 39.43 39.44 |
| Superv. setting Modbus protocol Speed 9600 baud ID 011 | Defines the connection parameters with the supervisor: protocol type, communication speed and unit identification number. | 39.45 39.46 39.47 |
| Select language: English Select language W 3000 | Selects the required language; "Select language" flashes on the last line in all the available languages. Once a language has been selected, the programme automatically switches to the first mask of the display menu. N.B.: Up to three languages are present on the board: Italian, English and another language. | 39.48 |
| Code CA 15.00 GB Man. C0240001-06-07 | This mask contains the reference information of the software [Code] and of the reference technical manual [Man.]. The closed padlock symbol shows that the board is provided with its propriety software; two padlocks appear on units with 3 or 4 circuits | |
| Enter another user password 0000 | Personalises the password by defining one that will replace the default password. | |
| Unit ← ↓ | Access mask to unit menu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| Temp. In. Out. Evap. 12.5 07.0°C Rec. 35.6 40.5°C Cond. 38.0 42.5°C | Displays inlet and outlet temperatures of the evaporator, recuperator and condenser (where fitted). | |
| Temp. In. Out. Evap. 12.5 07.0°C Evap1 07.2°C Evap2 06.9°C | (if 2 evaporators are fitted) Displays inlet and outlet temperatures of the evaporator or condenser (depending on whether the unit is in the chiller or heat pump mode) and the outlet temperature of the two evaporators. | |

| Mask | Description | Para n° |
|---|---|---------|
| Temp. In. Out. Cond. 24.3 22.4°C Cond.1 22.3°C Cond.2 22.4°C | (if 2 condensers are fitted) Displays inlet and outlet temperatures of the evaporator or condenser (depending on whether the unit is in the chiller or heat pump mode) and the outlet temperature of the two condensers. | |
| Temp. Freecooling 12.3°C External air 15.4°C Optional 19.6°C | (for water-air units) Displays freecooling temperature (in chiller+freecooling units), external air temperature and optional temperature (if the probes are enabled). | |
| hp Circ1 Circ2 07.3 07.3bar lp 04.2 03.9bar st Off Off | Displays high and low pressure values (if transducers are fitted) and codifies the operating mode of circuits 1 and 2. (see table at end of manual) | |
| hp Circ3 Circ4 07.3 07.3bar lp 04.2 03.9bar st Off Off | Displays high and low pressure values (if transducers are fitted) and codifies the operating mode of circuits 3 and 4. (see table at end of manual) | |
| Circ1 Circ2 tc 07.3 07.3 °C tl 00.0 00.0 °C sub 00.0 00.0 °C | (in chiller units with recovery) Displays pressure converted into temperature values, temperature of the liquid and calculated subcooling values of circuits 1 and 2. | |
| Circ3 Circ4 tc 07.3 07.3 °C tl 00.0 00.0 °C sub 00.0 00.0 °C | (in chiller units with recovery) Displays pressure converted into temperature values, temperature of the liquid and calculated subcooling values of circuits 3 and 4. | |
| Timer tuning defrost Range 1200 - 03600 s Free Defrost 0370 s | Displays, for timer tuning defrost, the variation range in the defrost delay calculated according to external temperature. Also displays the maximum duration of the free defrost calculated according to external temperature. | |
| Circ1 Circ2 Time 02700 02700 s Timer tuning defrost | Displays the defrost delay calculated by the timer tuning defrost algorithm. | |
| Circ3 Circ4 Time 02700 02700 s Timer tuning defrost | Displays the defrost delay calculated by the timer tuning defrost algorithm. | |
| Circ1 Circ2 Time 0188 0125 s Max 0290 0270 s Free Defrost | Displays the free defrost enable time and the maximum time calculated according to the length of the delay. | |
| Circ3 Circ4 Time 0188 0125 s Max 0290 0270 s Free Defrost | Displays the free defrost enable time and the maximum time calculated according to the length of the delay. | |
| Circ1 Circ2 defr N N T.del 0904 0000 s T.dur 0000 0028 s | Displays the defrosting status of circuits 1 and 2, the delay before defrosting starts and the time taken to defrost. | |
| Circ3 Circ4 defr N N T.del 0904 0000 s T.dur 0000 0028 s | Displays the defrosting status of circuits 3 and 4, the delay before defrosting starts and the time taken to defrost. | |
| Discharge temp. Comp.1 105.3°C Comp.2 098.4°C | Displays the discharge temperature (if probes are present) of compressors 1 and 2. | |
| Discharge temp. Comp.3 105.3°C Comp.4 098.4°C | Displays the discharge temperature (if probes are present) of compressors 3 and 4. | |
| Analogue outputs: Cond. 1 adj.:000 % Cond. 2 adj.:000 % | Displays analogue outputs 1 and 2. Shows the percentage of demand of the devices connected to it (for non-linear devices correspondence with supplied voltage V does not apply). Compares Cond.1-2 adj. with single or dual ventilation adjustment. | |
| Analogue outputs: Cond. 3 adj.:000 % Cond. 4 adj.:000 % | Displays analogue outputs 3 and 4. | |
| Analogue outputs: --- % --- % | Displays analogue outputs 5 and 6. | |
| Analogue outputs: 3 Freecooling :000 % --- % | Displays analogue outputs 1 and 2 of expansion 3. | |

| Mask | Description | Para n° |
|--|---|----------------------------------|
| Analogue outputs: Cond. 3 adj.:000 % Cond. 4 adj.:000 % | Displays analogue outputs 1 and 2 of the slave board. Shows the percentage of demand of the devices connected to it (for non-linear devices correspondence with supplied voltage V does not apply). Compares Cond. 3-4 adj. with single or dual ventilation adjustment. | |
| Analogue outputs: --- % --- % | Displays analogue outputs 3 and 4 of the slave. | |
| Analogue outputs: --- % --- % | Displays analogue outputs 5 and 6 of the slave. | |
| Analogue outputs: 3 Freecooling :000 % | Displays analogue outputs 1 and 2 of slave expansion 3. | |
| Hour counter Pump 1 000000 Pump 2 000000 | Displays the operating hours of the circulation pump (pump 2 appears only if two pumps are enabled). | |
| Compr. hour counter Av. hrs 000000 C1 000000 C2 000000 C3 000000 C4 000000 | Displays average compressor hours. Displays the operating hours of compressors 1, 2, 3 and 4. | |
| Comp.1 Work Req 078 << 082 Act 082% 32450rpm CR 02.82 | Displays the operating status of the centrifuge compressors, the request and effective activation, the rpm and the percentage delivered. | |
| outlet temp 78.5°C lp 03.9bar | Displays other data relative to the centrifuge compressors, such as outlet temperature and inlet pressure | |
| Comp.2 Work Req 075 << 080 Act 080% 29500rpm CR 02.84 | Displays the operating status of the centrifuge compressors, the request and effective activation, the rpm and the percentage delivered. | |

| Time band 10D Off Time 19:30 / 19:30 Sp S 09.0°C W 40.0°C Sp R 40.0°C | Setting band D, tenth daily time band. | 904.55 904.56 904.57 904.58 |
| Log ← ↓ | Access mask to Alarms Log menu. Press "Up" or "Down" to scroll the other masks and "Esc" to return to the submenu. | |
| 10:36:04 20/12/06 Event N°001 A002 Y Phase sequence | Access mask to alarms log (only visible if the clock card is installed). Each alarm registered contains the following details: date and time, alarm or report code, activation or deactivation event (S = set, R = reset), event number, alarm description. | |

4 TABLE OF MASKS W3000 base

| Mask | Description | Para n° |
|--------------------------|--|---------|
| level1 level2 level3 | | |
| OFF | Main display mask. Indicates the state of the unit ("ON", "OFF"). | |
| MODE | The submask displays the operating mode of the unit | |
| CH | "CH"=Chiller, "HP"= Heat Pump | |
| St | The submask displays the operating status of the unit | |
| ON K H | "ON K"= on from keypad, "ON D"= on from digital input, "ON B"= on from time bands, "ON S"= on from supervisor, "OFFA"= off from alarm, "OFFS"= off from supervisor, "OFFB"= off from time bands, "OFFD"= off from digital input, "OFFK"= off from keypad, "OFF"= off | |
| REQ | The submask displays the percentage of power requested by the thermoregulator | |
| SD | value ranging from 0 to 100 | |
| DEL | The submask displays the percentage of power delivered by the thermoregulator | |
| SD | value ranging from 0 to 100 | |
| PUMP | The submask displays the time remaining before the pump is switched on/off. | |
| SD | If the time decreases the unit is in the switching on/off phase. The time is expressed in seconds. | |
| EUIN | The submask displays the inlet temperature of the evaporator | |
| 12 .5 | temperature expressed in degrees centigrade | |
| EUO1 | The submask displays the outlet temperature of evaporator 1 | |
| 07 .2 | temperature expressed in degrees centigrade | |
| EUO2 | (If 2 evaporators are present). The submask displays the outlet temperature of evaporator 2 | |
| 06 .9 | temperature expressed in degrees centigrade | |
| CDIN | The submask displays the inlet temperature of the condenser (only for water/water units if the condenser inlet probe is enabled) | |
| 24 .3 | temperature expressed in degrees centigrade | |
| CDO1 | The submask displays the outlet temperature of condenser n° 1 (only for water/water units if the condenser outlet probe is enabled) | |
| | | |
| CDO2 | (If 2 condensers are present). The submask displays the outlet temperature of condenser n° 2 (only for water/water units if the condenser outlet probe is enabled) | |
| 22 .4 | temperature expressed in degrees centigrade | |
| EXT | (In water/air units, if the external air temperature probe is enabled). Displays external temperature | |
| 15 .6 | temperature expressed in degrees centigrade | |
| OPT | (In water-air units, if the operational temperature probe is enabled). Displays optional temperature | |
| 18 .8 | temperature expressed in degrees centigrade | |
| Menu | Service menu | |
| PROP | (Enable the "step adjustment" parameter first). The submask is used to set step adjustment. | |
| P | "P"=proportional adjustment, "P+I"=proportional + integral adjustment | 55.01 |
| LLS | The submask is used to set the lower limit of the chiller setpoint with inlet adjustment | |
| 0 | expressed in degrees centigrade | 55.04 |
| HL S | The submask is used to set the upper limit of the chiller setpoint with inlet adjustment | 55.05 |
| 0 | expressed in degrees centigrade | 55.06 |
| LLS | The submask is used to set the lower limit of the chiller setpoint with outlet adjustment | |
| 0 | expressed in degrees centigrade | 55.07 |
| HL S | The submask is used to set the upper limit of the chiller setpoint with outlet adjustment | |
| 0 | expressed in degrees centigrade | 55.08 |
| LLU | The submask is used to set the lower limit of the heat pump setpoint with inlet adjustment | |
| 0 | expressed in degrees centigrade | 55.09 |
| HL U | The submask is used to set the upper limit of the heat pump setpoint with inlet adjustment | |
| 0 | expressed in degrees centigrade | 55.10 |
| LLU | The submask is used to set the lower limit of the heat pump setpoint with outlet adjustment | |
| 0 | expressed in degrees centigrade | 55.11 |
| HL U | The submask is used to set the upper limit of the heat pump setpoint with outlet adjustment | |
| 0 | expressed in degrees centigrade | 55.12 |
| OFFFS | (Only in the quick mind adjustment mode). The submask is used to set the forced shutdown temperature in the chiller mode | |
| 4 .5 | expressed in degrees centigrade | 55.15 |
| OFFFU | (Only in the quick mind adjustment mode). The submask is used to set the forced shutdown temperature in the heat pump mode | |
| 51 .0 | expressed in degrees centigrade | 55.16 |
| Band | (Only visible in the step adjustment mode). The submask is used to set the temperature adjustment band | |

| Mask | Description | Para n° |
|----------------|---|---------|
| 0 | expressed in degrees centigrade | 55.17 |
| S E t U | The submask is used to enable setpoint variation | |
| n | "N"= disabled, "Y"= enabled | 55.20 |
| S E t t | The submask is used to set the setpoint variation signal type. | |
| 4 2 0 | "4-20"= 4-20 mA | 55.21 |
| S E t L | The submask is used to set the minimum variation, corresponding to the minimum signal | |
| 0 | expressed in degrees centigrade | 55.22 |
| S E t H | The submask is used to set the maximum variation, corresponding to the maximum signal | |
| 5 . 0 | expressed in degrees centigrade | 55.23 |
| P P r | (if 2 pumps are present on the evaporator). The submask is used to set the pump control type. | |
| A U t 0 | "AUTO"= automatic, "PMP1"= pump 1 only, "PMP2"= pump 2 only | 55.28 |
| P O n | The submask is used to set the minimum pump operation time when the unit is switched on | |
| 5 0 | time expressed in seconds | 55.29 |
| P O F | The submask is used to set the minimum pump switch-off time when the unit is switched off | |
| 5 0 | time expressed in seconds | 55.30 |
| P U r L | The submask is used to enable demand limit | |
| n | "N"=disabled, "Y"=enabled | 55.31 |
| 2 2 . 3 | temperature expressed in degrees centigrade | |
| 5 0 | value expressed in percent | 55.32 |
| P U r U | (If the "demand limit" parameter is enabled). The submask is used to set the power limitation percentage in the heat pump mode | |
| 0 | value expressed in percent | 55.33 |
| d I 0 | The submask is used to set the digital input for switching on/off the unit | |
| n | "N"= disabled, "Y"= enabled | 55.35 |
| d I 5 | (Only if the "operating mode" parameter is set on the heat pump). The submask is used to enable the digital input for the chiller/heat pump modes | |
| n | "N"= disabled, "Y"= enabled | 55.36 |
| S R L I | Evaporator antifreeze alarm setpoint | |
| 0 4 . 0 | temperature expressed in degrees centigrade | 35.29 |
| d R L I | Evaporator antifreeze alarm differential | |
| 0 4 . 0 | temperature expressed in degrees centigrade | 35.30 |
| S r I | Evaporator antifreeze heating element setpoint | |
| 0 4 . 0 | temperature expressed in degrees centigrade | 35.31 |
| d r I | Evaporator antifreeze heating element differential | |
| 0 4 . 0 | temperature expressed in degrees centigrade | 35.32 |
| P A S S | The submask is used to set the Service Password | |
| 0 | from 0 to 9999 | |
| U S E r | User menu | |
| r E G | The submask is used to set the adjustment type. | |
| 5 t E P | (Switch off the unit before changing this setting!!!). "STEP"= steps, "QM"= quick mind | 39.01 |
| F L O U | The submask is used to set the adjustment flow type. | |
| I n | "IN"= inlet flow, "OUT"= outlet type | 39.02 |
| B A n d | The submask can be used to enable time bands | |
| n | "N"= disabled, "Y"= enabled | 39.41 |
| S E r | The submask is used to enable the supervisor | |
| n | "N"= disabled, "SPV"= Supervision, "SQ"= Sequencer, "EDI"= Manager 3000 | 39.42 |
| P r O t | (If the "supervisor" is enabled). The submask is used to set the communication protocol. | |
| m O d B | "MODB"= modbus, "LON"= LonWorks, "STD"=standard Carel | 39.45 |
| B A U d | (If the "supervisor" is enabled). The submask is used to set the speed of communication expressed in bauds | |
| 1 2 0 0 | Possible values: "1200"-"2400"-"9600"-"19,2"=19200 | 39.46 |
| I d | (If the "supervisor" is enabled). The submask is used to set the identification n° for communicating in the supervisor network | |
| 0 | address | 39.47 |
| S U 0 | (If the "supervisor" is enabled). The submask is used to set on/off from the supervisor | |
| n | "N"= disabled, "Y"= enabled | 39.43 |
| S U n | (If the "supervisor" is enabled). The submask is used to enable the operating mode as supervisor | |
| n | "N"= disabled, "Y"= enabled | 39.44 |
| P A S S | The submask is used to set the user Password | |
| 0 | from 0 to 9999 | |
| C L H | Clock menu, not available on this keypad | |
| n O n E | | |
| I n P | Input/output menu | |
| d I R | Displays digital input 1:4 | |
| C C C C | C=closed,A=open. XXXX=[input1][input2][input3][input4] | |
| d I B | Displays digital input 5:8 | |

| Mask | Description | Para n° |
|----------------|--|----------------|
| C C C C | C=closed,A=open. XXXX=[input5][input6][input7][input8] | |
| d I C | Displays digital input 09:12:00 | |
| C C C C | C=closed,A=open. XXXX=[input9][input10][input11][input12] | |
| d I d | Displays digital input 13:15 | |
| C C C | C=closed,A=open. XXX=[input13][input14][input15] | |
| d O R | Displays digital output 1:4 | |
| C R R R | C=closed,A=open. XXXX=[output1][output2][output3][output4] | |
| d O B | Displays digital output 5:8 | |
| C R R R | C=closed,A=open. XXXX=[output5][output6][output7][output8] | |
| d O C | Displays digital output 9:12 | |
| R R R R | C=closed,A=open. XXXX=[output9][output10][output11][output12] | |
| R I 1 | Displays analogue input 1 | |
| 1 8 . 1 | value | |
| R I 2 | Displays analogue input 2 | |
| 1 7 . 9 | value | |
| R I 3 | Displays analogue input 3 | |
| 2 5 . 3 | value | |
| R I 4 | Displays analogue input 4 | |
| 3 0 . 2 | value | |
| R I 5 | Displays analogue input 5 | |
| 2 4 . 5 | value | |
| R I 6 | Displays analogue input 6 | |
| 2 4 . 5 | value | |
| R I 7 | Displays analogue input 7 | |
| 0 | value | |
| R I 8 | Displays analogue input 8 | |
| 0 | value | |
| R O 3 | Displays analogue output 3 | |
| 7 0 | value expressed in Volts | |
| R O 4 | Displays analogue output 4 | |
| 8 0 | value expressed in Volts | |
| S E T P | Setpoint menu | |
| n O d E | The submask is used to set the operating mode (this depends on the machine type set in the manufacturer menu using the W3000-compact keypad) | |
| C H | "CH"= Chiller, "HP"= heat pump | 43.01 |
| R C t | The submask displays the percentage of active power of the thermoregulator | |
| 5 0 | value ranging from 0 to 100 | |
| S U n | (If the FLOW parameter in the user menu is set to inlet). The submask is used to set the chiller setpoint with inlet adjustment | |
| 1 1 . 0 | expressed in degrees centigrade | 43.02 43.03 |
| S U n | (If the FLOW parameter in the user menu is set to outlet). The submask is used to set the chiller setpoint with outlet adjustment | |
| 9 . 5 | expressed in degrees centigrade | 43.05 |
| U I n | (If the FLOW parameter in the user menu is set to inlet). The submask is used to set the heat pump setpoint with inlet adjustment | |
| 0 | expressed in degrees centigrade | 43.04 |
| U I n | (If the FLOW parameter in the user menu is set to outlet). The submask is used to set the heat pump setpoint with outlet adjustment | |
| 0 | expressed in degrees centigrade | 43.06 |
| U n i t | Unit menu | |
| E U I n | Displays evaporator inlet temperature | |
| E U O 1 | Displays evaporator 1 outlet temperature | |
| E U O 2 | (If evaporator 2 is present). Displays evaporator 2 outlet temperature | |
| C d I n | (In water-water units, if the condenser inlet probe is enabled). Displays condenser inlet temperature | |
| C d O 1 | (In water-water units, if the condenser outlet probe is enabled). Displays condenser outlet temperature | |
| C d O 2 | (In water-water units with two condensers, if the condenser 2 outlet probe is enabled). Displays condenser 2 outlet temperature | |
| E H t | (In water/air units, if the external air temperature probe is enabled). Displays external temperature | |
| O P t | (In water-air units, if the operational temperature probe is enabled). Displays optional temperature | |
| H P 1 | Displays circuit 1 high pressure | |

| Mask | Description | Para n° |
|----------------|--|---------|
| 0 | high pressure value | |
| H P 2 | Displays circuit 2 high pressure | |
| 0 | high pressure value | |
| R 0 3 | Displays value of analogue output 3 | |
| 0 | value expressed in percent | |
| R 0 4 | Displays value of analogue output 4 | |
| 0 | value expressed in percent | |
| H H 1 | Displays compressor 1 operating hours expressed in thousands | |
| 1 | e.g.: "1"=1000 hours | |
| L H 1 | Displays compressor 1 operating hours expressed in units | |
| 5 0 | e.g.: "50"=50 hours | |
| H H 2 | Displays compressor 2 operating hours expressed in thousands | |
| 1 | e.g.: "1"=1000 hours | |
| L H 2 | Displays compressor 2 operating hours expressed in units | |
| 5 0 | e.g.: "50"=50 hours | |
| S E L 1 | Enables compressor 1 | |
| N | "N"=deselected, "Y"= selected | 47.05 |
| S E L 2 | Enables compressor 2 | |
| N | "N"=deselected, "Y"= selected | 47.06 |
| C R 1 3 | Software release | |
| r . 0 0 | Software revision | |
| 0 0 R | No alarm active | |

5 PARAMETERS TABLE

| Para n° | Description of parameter | Default | U.M. | Min. | Max. |
|---------|--|---------|------|---------|---------|
| 01.01 | Type of unit (0:chiller - 1:heat pump - 2:multi-use) | 0 | - | 0 | P 99.01 |
| 01.02 | Type of compressors (0:centrifuge - 1:hermetic - 2:semi-hermetic - 3:screw) | 1 | - | P 99.25 | P 99.02 |
| 01.03 | N° circuits | 2 | - | 1 | P 99.03 |
| 01.04 | N° compressors per circuit | 1 | - | 1 | P 99.04 |
| 01.05 | N° separation stages per compressor | 0 | - | 0 | P 99.05 |
| 01.06 | Condensation type (0:none - 1:air - 2:water) | 1 | - | 0 | 2 |
| 01.07 | N° condensers | 1 | - | 1 | 2 |
| 01.08 | Reversal side for chiller-heat pump (0:water - 1:freon) | 0 | - | | |
| 01.09 | Fan type (0:axial - 1:centrifuge) | 0 | - | 0 | 1 |
| 01.10 | Evaporation type (0:none - 1:water) | 1 | - | 1 | P 99.31 |
| 01.11 | N° evaporators | 1 | - | 0 | P 99.06 |
| 01.12 | N° evaporating coils | 1 | - | 1 | P 01.03 |
| 01.13 | Freon type (0: R22 - 1: R134a - 2: R404a 3: R407c - 4: R410a 5: R507c - 6: R290 - 7: R600 - 8: R600a - 9: R717 - 10: R744) | 3 | - | 0 | 10 |
| 01.14 | Recovery enable (0:disabled - 1:enabled) | 0 | - | | |
| 01.15 | Freecooling enable (0:disabled- 1:enabled) | 0 | - | | |
| 01.16 | Condenser inlet temperature probe enable (0:disabled - 1:enabled) | 0 | - | | |
| 01.17 | External air temperature probe enable (0:disabled - 1:enabled) | 0 | - | | |
| 01.18 | Pressure transducers enable (0:disabled - 1: enabled) | 0 | - | | |
| 01.19 | Low pressure transducers enable (0:disabled - 1: enabled) | 0 | - | | |
| 01.20 | Start scale value of high pressure transducers | 0.0 | bar | 0.0 | P 01.21 |
| 01.21 | End scale value of high pressure transducers | 30.0 | bar | P 01.20 | 45.0 |
| 01.22 | Start scale value of low pressure transducers | 0.0 | bar | 0.0 | P 01.23 |
| 01.23 | End scale value of low pressure transducers | 30.0 | bar | P 01.22 | 45.0 |
| 01.24 | Optional temperature probe enable (0:disabled - 1:enabled) | 0 | - | | |
| 01.25 | Condenser outlet temperature probe enable (0:disabled - 1:enabled) | 0 | - | | |
| 05.02 | Winter setpoint limitation enable (0:disabled - 1:enabled) | 0 | - | | |
| 05.07 | Winter setpoint limitation setpoint | -5.0 | °C | -30.0 | 0.0 |
| 05.08 | Winter setpoint limitation differential | 5.0 | °C | 0.0 | 20.0 |
| 05.09 | Maximum variation for winter setpoint limitation | 5.0 | °C | 0.0 | 20.0 |
| 05.10 | Minimum limit for winter setpoint limitation | 45.0 | °C | 26.0 | 70.0 |
| 05.11 | Coil fractioning enable (0:disabled - 1:enabled) | 0 | - | | |
| 05.12 | Upper setpoint | 10.0 | bar | 0.0 | P 01.21 |
| 05.13 | Upper differential | 5.0 | bar | 0.0 | 10.0 |
| 05.14 | Lower setpoint | 12.0 | bar | 0.0 | P 01.21 |
| 05.15 | Lower differential | 0.5 | bar | 0.0 | 10.0 |
| 05.16 | Subcooling enable (0:disabled - 1:enabled) | 0 | - | | |
| 05.17 | Start delay for subcooling adjustment | 10 | s | 0 | 120 |
| 05.18 | Activation delay for subcooling relay | 5 | s | 0 | 120 |
| 05.19 | Upper setpoint for opening/closing subcooling valves | 6.0 | °C | 0.0 | 20.0 |
| 05.20 | Lower setpoint for opening/closing subcooling valves | 4.0 | °C | 0.0 | 20.0 |
| 05.21 | Enable high temperature pressure switch control (0:disabled - 1:enabled) | 0 | - | | |
| 05.22 | Pressure switch high temperature control setpoint | 23.5 | bar | P 01.20 | P 01.21 |
| 05.23 | Pressure switch high temperature control differential | 2.0 | bar | 0.0 | 5.0 |
| 05.24 | Pumpdown type (0:enabled - 1:during shutdown - 2:cyclical - 3:during shutdown and cyclical) | 0 | - | 0 | 3 |
| 05.25 | End pumpdown setpoint | 2.5 | bar | 0.1 | 7.0 |
| 05.26 | Maximum pumpdown time | 3 | s | 3 | 60 |
| 05.27 | Timeout for performing cyclical pumpdown | 30 | min | 1 | 999 |
| 05.28 | Configure pumpdown start modes | 0 | - | 0 | 31 |
| 05.29 | Enable valve override on all-in-one unit (0:disabled - 1:enabled) | 1 | - | | |
| 05.30 | Modulating subcooling control enable for TECS (0:disabled - 1:enabled) | 0 | - | | |
| 07.01 | Number of pumps on the evaporator | 1 | - | 0 | P 99.24 |
| 07.03 | Recuperator pump enable (0:disabled - 1: enabled) | 0 | - | | |
| 07.04 | Condenser pump enable (0:disabled - 1: enabled) | 0 | - | | |
| 07.08 | Maximum acceptable continuous operating time of a pump before rotation is forced | 7 | gg | 1 | 1500 |
| 07.09 | Maximum difference in days between the two pumps before the 'Threshold' value of the pump is doubled | 60 | gg | 1 | 9999 |
| 07.10 | Pump override enable during a long period of inactivity (0:No - 1:Yes) | 1 | - | | |
| 07.11 | Threshold time for long period of inactivity | 30 | gg | 1 | 1500 |
| 07.12 | Duration of pump override for long period of inactivity | 10 | s | 1 | 999 |
| 09.02 | Minimum compressor shut-down time (with step adjustment) | 120 | s | 1 | 500 |
| 09.03 | Minimum time between start-ups of different compressors (with step adjustment) | 10 | s | 1 | 500 |
| 09.04 | Minimum time between start-ups of the same compressor (with step adjustment) | 360 | s | 1 | 900 |

| Para n° | Description of parameter | Default | U.M. | Min. | Max. |
|---------|---|---------|--------|---------|---------|
| 09.05 | Maximum number of compressor start-ups (with Quick Mind or modulating adjustment of screw compressors) | 10 | - | 1 | 12 |
| 09.06 | Maximum compressor start-up time (with Quick Mind or modulating adjustment of screw compressors) | 150 | s | 1 | 500 |
| 09.07 | Enables 100% screw compressor forcing (0:disabled - 1:enabled) | 0 | - | | |
| 09.08 | Minimum separation mode temperature setpoint | -5.0 | °C | -30.0 | 0.0 |
| 09.09 | Separation re-activation differential | 1.0 | °C | 0.5 | 10.0 |
| 09.11 | Maximum separation time before 100% screw compressor forcing | 1200 | s | 1 | 7200 |
| 09.12 | 100% forcing time following maximum separation time control | 120 | s | 1 | 300 |
| 09.14 | Period for power increase impulse (only modulating adjustment of screw compressors) | 10 | s | 0 | 999 |
| 09.15 | Minimum duration of charge impulse (only modulating adjustment of screw compressors) | 0.3 | s | 0.0 | P 09.16 |
| 09.16 | Maximum duration of charge impulse (only modulating adjustment of screw compressors) | 2.0 | s | P 09.15 | 99.9 |
| 09.17 | Period for power decrease impulse (only modulating adjustment of screw compressors) | 10 | s | 1 | 999 |

5.1 Table of parameter limits (depending on unit configuration)

| Para n° | Description of parameter |
|---------|---|
| 99.01 | Maximum settable limit for configuring the machine type (depends on the type of hardware and the type of compressor): - with hardware L and centrifuge compressors (0:chiller) - with hardware B (1:chiller and heat pump) - other cases (2:chiller, heat pump, all-in-one) |
| 99.02 | Maximum settable limit for choosing the type of compressor (depends on the type of board installed): - with hardware B (1:hermetic) - with hardware L (1:centrifuge or hermetic) - with hardware XL (3:alternative or screw) |
| 99.03 | Maximum number of circuits (depends on the type of hardware): - with hardware B (2: maximum 2 circuits) - other cases (4: maximum 4 circuits, slave board required) |
| 99.04 | Maximum number of compressors per circuit (depends on the type of hardware and the configured type of compressors): - screw compressors (1:maximum one comp. per circuit) - alternative compressors (2:maximum two comp. per circuit) - hardware B with 1 circ. (2:maximum two comp. on the same circuit) - hardware B with 2 circ. (1:maximum one comp. per circuit) - centrifuge comp. with 1 circ. (4:maximum four comp. per circ.) - centrifuge comp. with 2 circ. (2:maximum two comp. per circ.) - centrifuge comp. with 4 circ. (1:maximum one comp. per circ.) |
| 99.05 | Maximum number of separation stages per compressor (depends on the set type of compressor): - with hermetic compressors (0:no separation stages) - other cases (2:maximum two separation stages per compressor) |
| 99.06 | Maximum number of evaporators (depends on the type of hardware and the number of configured cooling circuits): - with hardware B (1: maximum one evaporator) - with 2 cooling circuits (2:maximum two evaporators) - with 4 cooling circuits (4:maximum four evaporators) |
| 99.07 | Maximum value settable for the operating mode (depends on the configured type of machine): - Chiller (3:chiller) - Chiller + freecooling (7:chiller or chiller+fc) - Chiller + recovery (2:chiller+rec or chiller) - Heat pump (3:chiller or heatpump) - All-in-one unit (0:auto, recovery, chiller+rec or chiller) - Heat pump with recovery (10:summer auto, summer rec, summer ch+rec, summer ch., winter hp., winter rec or winter auto) |
| 99.08 | Maximum settable value for the operating mode (depends on the configured type of machine): - Chiller (3:chiller) - Chiller + freecooling (8:chiller or chiller+fc) - Chiller + recovery (3:chiller+rec or chiller) - Heat pump (4:chiller or heatpump) - All-in-one unit (3:auto, recovery, chiller+rec or chiller) - Heat pump with recovery (16:summer auto, summer rec, summer ch+rec, summer ch., winter hp., winter rec or winter auto) |
| 99.09 | Minimum settable value for the minimum chiller setpoint equal to anti-freeze setpoint + 2 °C (P35.29+2 °C) |
| 99.10 | Maximum settable value for the minimum chiller setpoint, depends on the set type of adjustment: - with step adjustment on inlet (P43.03) - with quick mind adjustment on inlet (P43.02) |
| 99.11 | Minimum chiller setpoint limit (depends on the type of adjustment): - with step adjustment on inlet (P55.05) - with quick mind adjustment on inlet (P55.04) - with adjustment on outlet (P55.07) |
| 99.12 | Maximum chiller setpoint limit (depends on the type of adjustment): - with adjustment on inlet (P55.06) - with adjustment on outlet (P55.08) |
| 99.13 | Minimum heat pump setpoint limit (depends on the type of adjustment): - with adjustment on inlet (P55.09) - with adjustment on outlet (P55.11) |
| 99.14 | Maximum heat pump setpoint limit (depends on the type of adjustment): - with adjustment on inlet (P55.10) - with adjustment on outlet (P55.12) |
| 99.18 | Advanced time band enable limit, depends on the advanced time band enable (P900.01): - with standard time band prog.: 1 (A bands), - with advanced time band prog.: 4 (bands A, B, C and D) |
| 99.19 | Minimum settable value for controlling time bands (depends on parameter settings) (1:off) |
| 99.20 | Maximum settable value for controlling time bands (depends on parameter settings) (2:adjustment) |
| 99.21 | Negated value of parameter: (P19.03+3 °C) |

| Para n° | Description of parameter |
|---------|---|
| 99.23 | Maximum number of available ventilation steps (depends on the type of board used and the configured type of compressors): - hardware XL (4:maximum four ventilation steps) - unit with centrifuge compressors (4:maximum four steps) - other cases (3:maximum three ventilation steps) |
| 99.24 | Maximum number of pumps available from board (2: maximum two pumps) |
| 99.25 | Minimum settable limit for choosing the compressor type (depends on the type of board installed): - with hardware B (1:hermetic) - with hardware L (0:centrifuge or hermetic) - with hardware XL (2:alternative or screw) |
| 99.26 | Possible ventilation type, depends on the number of cooling circuits: - unit with 4 circuits (2: separate, single or dual ventilation) - unit with 3 circuits (0: separate ventilation) - unit with 1 or 2 circuits (1: separate or single ventilation) |
| 99.28 | Maximum upper Timer-Tuning-Defrost band limit. This is the result of (maximum defrost time)-(reference time calculated by the system according to weather conditions and the unit operating mode) (P21.05 - P21.07 o P21.05 - P21.08) |
| 99.29 | Maximum settable chiller setpoint limit with inlet adjustment of: High inlet temperature alarm setpoint-7°C (P35.41 - 7°C) |
| 99.30 | Maximum settable chiller setpoint limit with outlet adjustment of: High inlet temperature alarm setpoint-12°C (P35.41 - 12°C) |
| 99.31 | maximum limit for the configurable type of evaporators (1:no evaporation or water evaporation) |
| 99.32 | maximum limit for setting the screw compressor oil management algorithms (depends on the set type of adjustment): - with modulating adjustment (1: none or direct) - with step adjustment (3: none, direct, indirect or direct+indirect) |

6 DIAGRAMS

This section explains how some operating algorithms work. Most of the configuration parameters are contained in the manufacturer and service menus; the tree diagram for navigation is shown below.

Enter the manufacturer menu (not present in W3000 base) by pressing [Menu] / selecting the manufacturer menu by pressing [UP] / entering the password. The tree diagram of the manufacturer menu is shown in *figure 6.0a*.

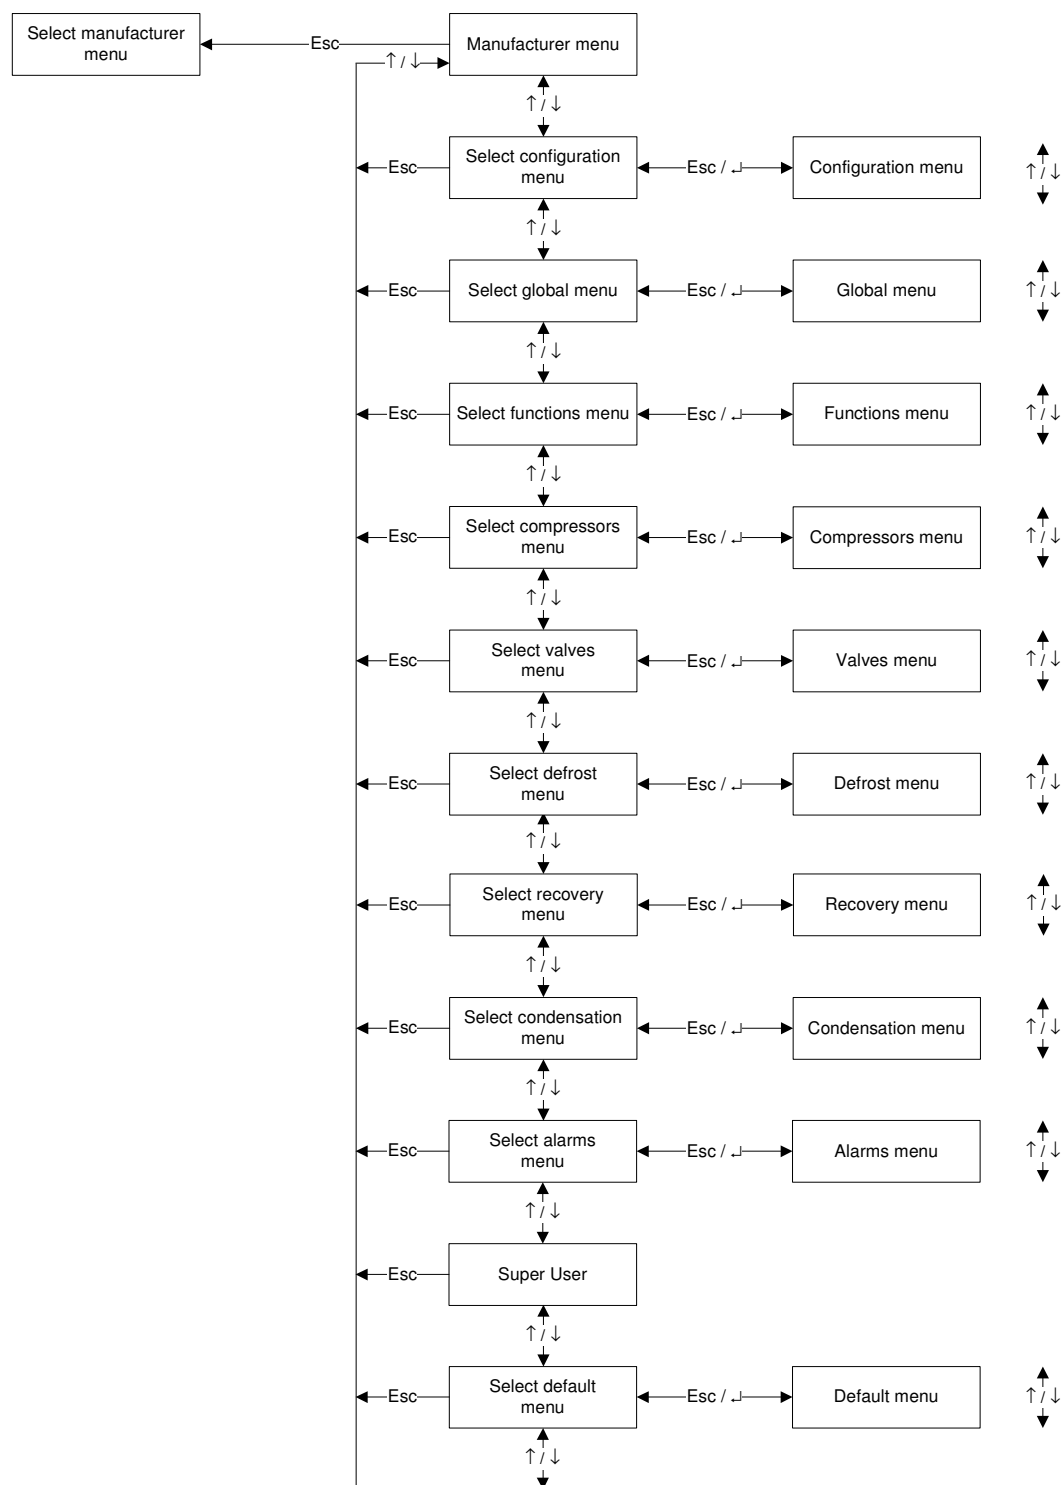

Figure 6.0a : manufacturer menu tree diagram

Enter the service menu (only partly present in W3000 base) by pressing [Menu] / selecting the service menu by pressing [UP] / entering the password. The tree diagram of the service menu is shown in *figure 6.0b*.

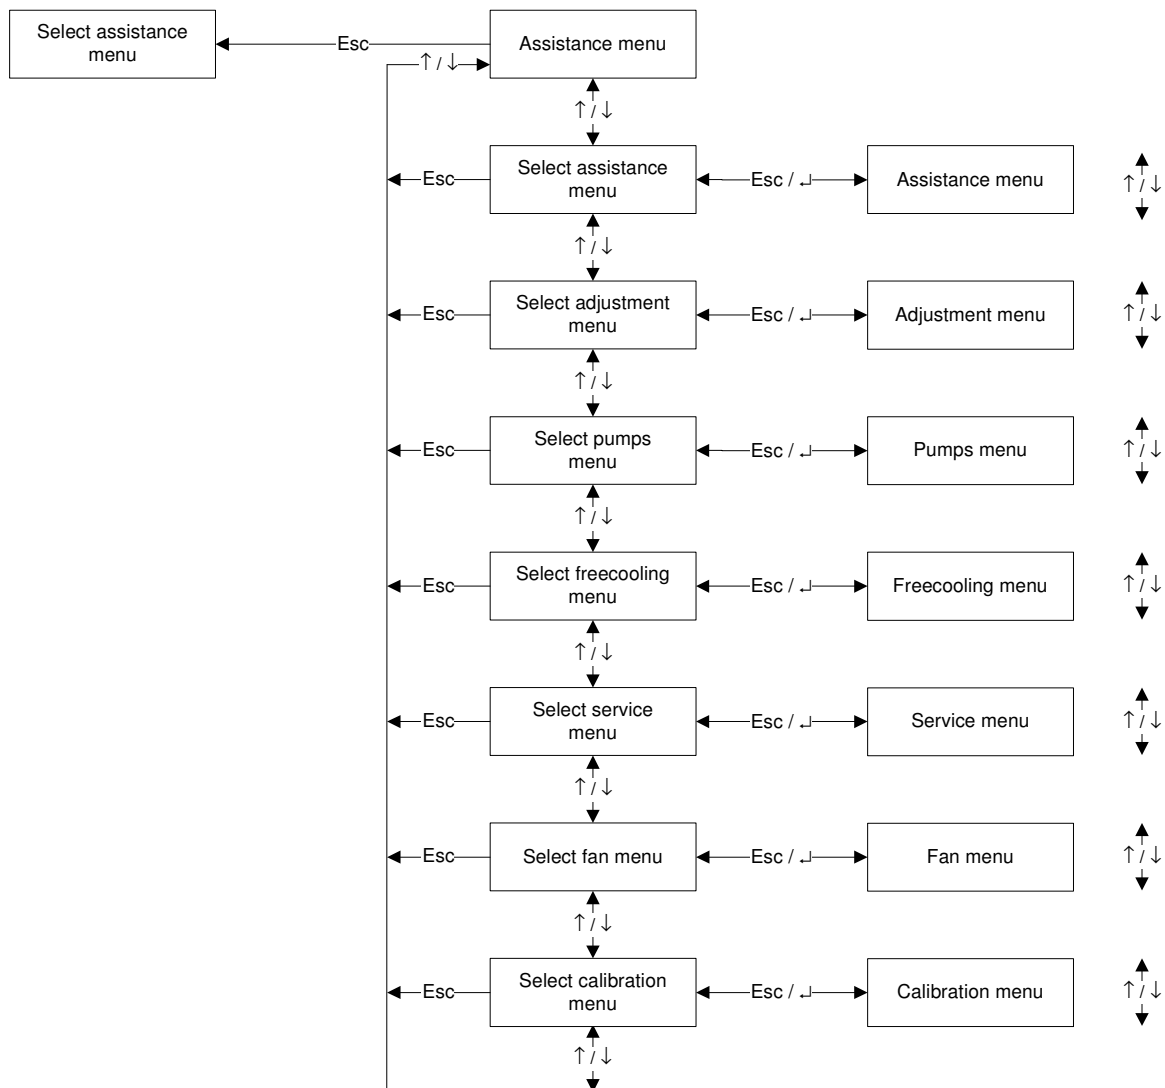

Figure 6.0b : service menu tree diagram

6.1 Freecooling

The "freecooling" function is applied to the efficient production of cold water by using external air. The operating principle is illustrated in the *following figure*

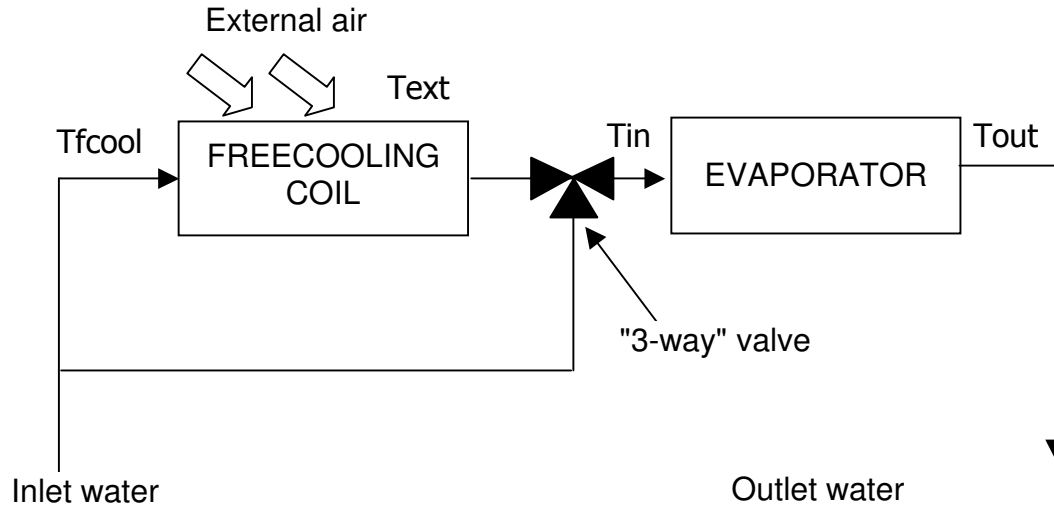

Figure 6.1: block diagram of the freecooling activation circuit

If the external water is cold, the valve closes and the water passes through the coil which cool the water by the water-air heat exchange achieved thanks to the internal fans. If, instead, the air is hot, there is no point in it passing through the coil and all the water is cooled with the evaporator compressors. Further details of the valve and fan adjustment system are shown in figures 6.2.

Figure 6.2a: operation of the valve (On/Off or modulating) depending on the difference between the unit inlet temperature (T_{fcool}) and that of the external air (T_{ext})

Figure 6.2b: control in low freecooling temperature: to prevent the risk of the coil freezing, the valve is closed below a suitable offset

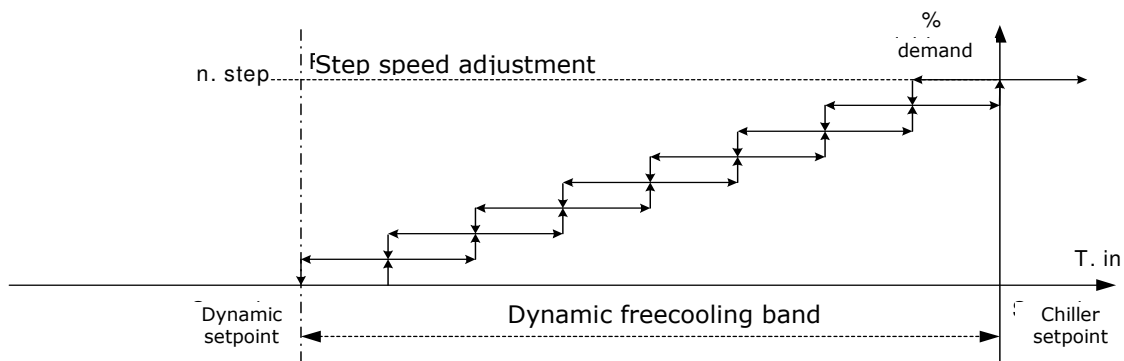

Figure 6.2c: fan adjustment in the step mode (example with 8 fans)

Figure 6.2d: fan adjustment in the continuous mode

6.2 Condensation

Condensation adjustment depends on how the fans are turned on. Various condensation adjustment types in the "chiller" operating mode are shown below. The fans may be turned on using the on/off system ("step") in which the fans are turned on progressively one after the other (figure 6.3a) or mutually excluded (figure 6.3b). Fans switched on in parallel but that increase fan speed (depending on pressure) are illustrated in figure 6.3c).

Figure 6.3a: "continuous step" condensation adjustment

Figure 6.3b: "step" condensation adjustment

Figure 6.3c: "step" condensation adjustment

9 CONNECTING SEVERAL BOARDS

Caution: , perform the following operations before touching the boards in order to prevent electrostatic discharge:

- wear the bracelet (connected to the earth circuit) and the heel strap
- the board should be closed inside an antistatic bag protecting it from electrostatic discharge: remove it from the bag and place it on the light-blue mat with the yellow edge or on the dark-blue mat.
- You can now work on the board.

Several boards can be connected together.

There are two connection types: "base-expansion" on the expansion serial line and "master-slave" on the "plan" serial line. The "mixed" connection is a combination of the other two.

9.1 "BASE-EXPANSION" Connection

In the "base-expansion" connection, the entire intelligence of the unit resides in the base. The connected expansions are exclusively used as additional I/O. The boards must be connected together with a three-wire shielded cable connected from terminal J23 of the base to terminal J3 of expansion "E" or to terminal J11 of expansion "M" (see figure below).

"W3000 exp" software must be installed in expansion "M" while no software application is required for expansion "E".

Figure 9.1: "base-expansion" connection

A certain number of expansions are present depending on the type of boards and the enabled functions. A specific address must be given for each expansion.

EXPANSIONS FOR HERMETIC COMPRESSORS

| Additional function | Function, chiller type | Expansion address | Expansion type |
|---|---|-------------------|----------------|
| Recovery enable | Chiller with heat recovery | 1 | E |
| Low external air temperature kit | Heat pump for low external air temperatures | 1 | E |
| Recovery enable | Multi-purpose Heat pump with total heat recovery | 2 | M |
| Freecooling enable Coil fractioning enable Low temperature control enable Low pressure transducer enable | Freecooling chiller Unit with fractioned coil Low temperature chiller Any unit with hermetic compressors where low pressure is required to be monitored (except for All-in one units and Heat pumps with total recovery) | 3 | E |

EXPANSIONS FOR ALTERNATIVE AND SCREW COMPRESSORS

| Additional function | Function, chiller type | Expansion address | Expansion type |
|--|--|-------------------|----------------|
| Recovery enable | Chiller with heat recovery | 1 | E |
| Recovery enable | Multi-purpose Heat pump with total heat recovery | 2 | M |
| Freecooling enable Coil fractioning enable Setpoint variation enable from external signal Recovery setpoint variation enable from external signal Dual setpoint enable from external contact | Freecooling chiller Unit with fractioned coil Unit with setpoint variation or dual setpoint | 3 | E |
| Number of evaporators 0 Number of compressors per circuit 2 | Condensing units Unit with 2 alternative compressors per circuit | 4 | E |
| At least one pump enable Heat pump External temperature probe enable Optional temperature probe enable Recovery enable Freecooling enable Coil fractioning enable Low temperature control enable 2 evaporators | Chiller with pumps on board Heat pump chiller Unit with external temp. probe Unit with optional temp. probe Chiller with heat recovery Freecooling chiller Unit with fractioned coil Low temperature chiller Chiller with more than one evaporator | 5 | E |

EXPANSIONS FOR CENTRIFUGAL COMPRESSORS

| Additional function | Function, chiller type | Expansion address | Expansion type |
|---------------------|---------------------------------------|-------------------|----------------|
| Bypass valve enable | Bypass valve for starting compressors | 1 | E |

9.2 "MASTER-SLAVE" connection

Intelligence is distributed instead in the "master-slave" connections. Suppose we have a unit with 4 cooling circuits: the master board manages circuits 1 and 2 while the slave board manages circuits 3 and 4. In this case, the additional board is not simply an input/output expansion, but is fully involved managing part of the unit. The board software is the same and identifies its functions depending on the board address: the one with address 1 will be the master and will communicate with the board with address 11 (master address plus 10). Pay special attention to board addresses for this reason. Connect the boards together with a 3-wire shielded cable connected between terminals J11 of the boards, as shown in the figure below.

Figure 9.2: "master-slave" connection

9.3 "Mixed" connection

The "mixed" connection is used in units with 3/4 cooling circuits where an increase in inputs/outputs is required. The master board manages circuits 1 and 2 while the slave board manages circuits 3 and 4. Additionally, depending on the required functions or the type of machine, boards used as expansions can be connected.

Connect the expansions for the I/O of circuits 1 and 2, and for the unit I/O to the master.

Connect the expansions for the I/O of circuits 3 and 4 to the slave

The following figure shows the connections between the boards and the expansions: a 3-wire shielded cable connects terminals J11 of the master and slave boards (marked in orange), and a 3-wire shielded cable connects terminals J23 of the master and/or slave boards with terminal J3 or J11 of expansions "E" or "M" (marked in blue).

Figure 9.3a: "mixed" connection

Figure 9.3b: "mixed" connection

10 Terminal configuration

The first thing to do when connecting the boards of several units in a network in order to have a remote keypad or replace a board, is to configure the terminals.

This cannot be achieved with the basic W3000 keypad. In this case, configure the terminals using the W3000 or W3000 compact keypad and afterwards reconnect the W3000 basic display.

Before starting, it is advisable to check that each board and each terminal has been identified with the correct address established when the network was designed. It is important to remember that as the set address is only read by the boards during start-up, it is best to perform a global reset of all the devices if a mistake is made when configuring the addresses (more than one board with the same address). Reset the network by disconnecting all the devices from the power supply .

The configuration procedure can be activated from any terminal (keyboard), which may also be connected temporarily only to perform configuration operations and removed upon completion. The operations to perform are described in the following paragraphs.

10.1 Setting the keypad address

After connecting the keypad to the device, perform the following procedure:

| | | |
|----|---|--|
| 1) | Press [UP], [DOWN] and [ENTER] together and hold down until the mask shown to the side appears. | Display address Setting.....:00 I/O Board address: |
| 2) | Press [ENTER] to move the cursor to "Display address setting". Press [UP] and [DOWN] to set the required keypad address (e.g.: 21). | Display address Setting.....:21 I/O Board address:-- |
| 3) | This mask means that the address of the keyboard has been set. | Display address changed |
| 4) | If an empty mask or a mask showing "NO LINK" appears after pressing [ESC], it means that the keypad is not communicating with any board. Either the board must be addressed or the plan network must be configured. | NO LINK |

N.B.: This is a *timed procedure*; if the parameters are not set within a few seconds, the display turns off. In this case, the operation must be repeated.

10.2 Setting the board address

The board address is set by the software using the keypad.
Proceed as follows:

| | | |
|---|--|---|
| 1 | Make sure the keypad address is set to 0 (see keypad address settings para) | Display address Setting.....:00 I/O Board address: |
| 2 | Disconnect the board from the power supply (turn off the general switch). | |
| 3 | Power the board by pressing [ALARM] and [UP] together ; hold the keys down until the mask shown to the side appears. | pLan address: 0 UP: increase DOWN: decrease ENTER: save & exit |
| 4 | Set the required address (e.g.: 1) To do this, press [UP] or [DOWN]; press [ENTER] to confirm. | pLan address: 1 UP: increase DOWN: decrease ENTER: save & exit |
| 5 | An "empty" mask appears because the address of the keyboard is 0 and that of the board is (as shown in the example) 1; the two devices cannot communicate. In any case, board address 1 has been set. | |
| 6 | Now perform "PLAN NETWORK CONFIGURATION " to allow the board to communicate with its keypad | |

10.3 Plan network configuration

10.3.1 Plan network connection (local)

For each unit with an on-board keyboard, perform the following procedure to create a "local" plan network:

| | | |
|---|---|--|
| 0 | Make sure the board has been addressed (as described in the previous paragraph). | pLan address: 1 UP: increase DOWN: decrease ENTER: save & exit |
| 1 | Press [UP], [DOWN] and [ENTER] together and hold down until the mask shown to the side appears. | Display address Setting.....:00 I/O Board address: |
| 2 | Set the required address for the keyboard (e.g.: 21) | Display address Setting.....:21 I/O Board address:-- |
| 3 | Press [ENTER] to display the address of the boards in pLan (in this case 1). N.B.: If there is more than one board, press [UP] or [DOWN] to choose which board to configure. | Display address Setting.....:21 I/O Board address:01 |
| 4 | Press [ENTER] to configure the terminals of the selected board; press [ENTER] to confirm | Terminal config Press ENTER To continue |
| 5 | In this mask, the [ENTER] key moves the cursor from one field to another and the [UP] or [DOWN] keys change the values. P:01 means that the board with address 1 is being configured. | P:01 Adr Priv/Shared Trm1 None -- Trm2 None -- Trm3 None -- Ok?No |
| 6 | Configure keyboard 21 (previously set) as Pr=private (usually the one on the unit). (Sp=printer, or Sh=shared) | P:01 Adr Priv/Shared Trm1 21 Pr Trm2 None -- Trm3 None -- Ok?No |
| 7 | The remote keyboard must also be configured. Simply define the keyboard addressed with 32 (even if not present) as Sh. | P:01 Adr Priv/Shared Trm1 21 Pr Trm2 32 Sh Trm3 None -- Ok?No |
| 8 | To save the settings and exit the configuration procedure, move the cursor to "No", change it to "Yes" and press [ENTER]. To exit without saving the settings, wait 30 seconds without touching the keyboard. | P:01 Adr Priv/Shared Trm1 21 Pr Trm2 32 Sh Trm3 None -- Ok?Yes |
| 9 | The following mask may appear. If no expansions are connected, simply press [ESC] to show the main display menu. | ##### ...expansion link... ##### |

To connect several units together and remote control them, thereby forming a plan network (global), a remote keypad controlling all the units is required.

The remote keypad cannot be a W3000 base keypad. If a W3000 basic keypad is installed on the machine, replace it with a 3000 compact.

10.3.2 Configuring the plan network (global)

It is easy to install a PLAN network (global). Just a few but essential operations are required. If just one of these is not performed correctly, the entire system will not work.

The remote keyboard will work problem-free if the following operations are performed one after the other.

| | | |
|----|--|---|
| 1 | Set the on-board machine board and keyboard addresses (see configuring the local plan network) | Configure the addresses of each board and keypad (with a univocal address in the network), leaving the network cable disconnected (connector J11) |
| 2 | Check the chillers work correctly without being connected to the network. | |
| 3 | Disconnect the power supply from the chillers | |
| 4 | Connect all the chillers to the network except for the remote keyboard. | Connect connectors J11 together. Do not connect the remote keyboard. This creates a plan network comprising more than one chiller. |
| 5 | Power the chillers. | |
| 6 | Check that all the networked devices (boards and keypads) work correctly | If any faults occur, check the configuration of the terminals to make sure that no two devices have the same address. |
| 7 | Connect the remote keypad to one of the units | Disconnect the machine keyboard and connect the remote keypad to the J10 connector. |
| 8 | Make sure the remote keyboard address is set to 32. | Follow the procedure for addressing the keyboard. |
| 9 | Make sure that the devices outside the chillers are correctly configured. | If the power unit for the remote keypad is fitted (see below: remote keypad from 200 up to 500 metres), make sure the remote keypad is powered. |
| 11 | Connect the remote keyboard. | Disconnect connector J10 from the last board and connect it to connector "A" of the "T" shunt. Connect connector J10 on the last board to connector "B" of the "T" shunt. |
| 10 | Wait a few seconds until network communication has stabilised. | |

- In a global network comprising *just W3000 chillers*, the W3000-compact can be used as a remote keyboard. After configuring the various units (each with a different address in order not to generate conflicts in the global network), connect the remote keyboard and repeat the procedure. In this network type, the various machines of the network are switched by pressing [ESC] and [UP] together.
- If the plan network *does not comprise just W3000 chillers*, a 16-key keyboard must be used. Press [UNIT] to switch between one board and another. The terminals, however, must be given a special configuration as the 16-key keyboard is only recognised on "terminal 3". Then configure the local plan network. Follow the same procedure up to point 6 and then modify the subsequent points as follows:

| | | |
|---|---|---|
| 7 | The remote keyboard can be configured even if the plan network does not comprise just W3000 chillers. Simply define the keyboard addressed with 32 (N.B.: on terminal 3) as Sh, i.e.: shared. | P:01 Adr Priv/Shared Trm1 21 Pr Trm2 None -- Trm3 32 Sh Ok?No |
| 8 | To save the settings and exit the configuration procedure, move the cursor to "No", change it to "Yes" and press [ENTER]. To exit without saving the settings, wait 30 seconds without touching the keyboard. | P:01 Adr Priv/Shared Trm1 21 Pr Trm2 None -- Trm3 32 Sh Ok?Yes |

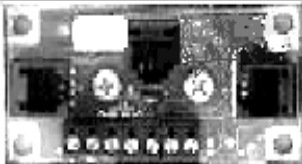

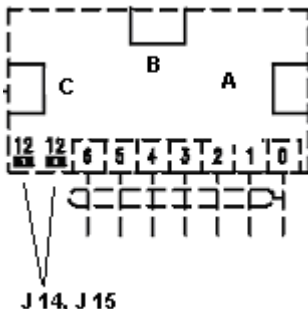

10.4 Connecting the remote keypad

Usually, just the keyboard on the chiller is used. This is connected directly to connector J10. It is possible to connect a remote keyboard to the chillers and choose between various configurations.

10.4.1 "T" shunt

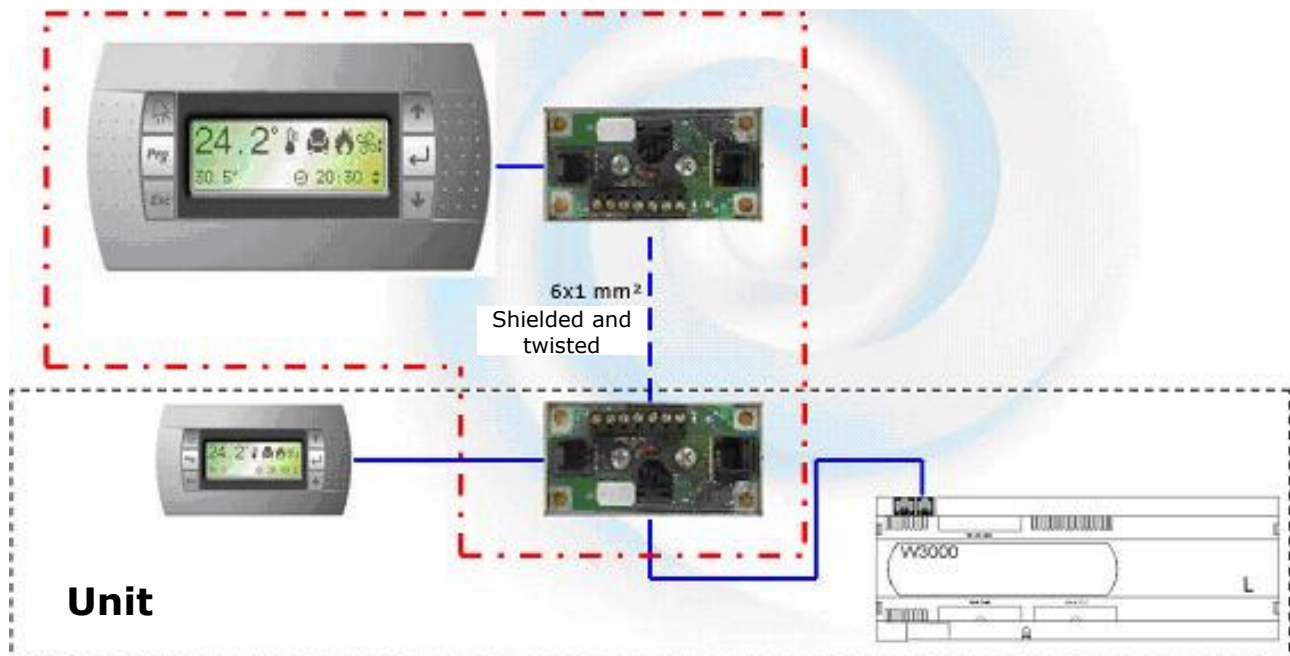

This is a shunt with phone connectors that is used in both the local and global plan network. The two jumpers J14 and J15 must short circuit pins 1 and 2. There is also a terminal board. The meanings of the various terminals are explained below.

| 1. | Imagine of a T shunt. |  | | | | | | | | | | | | | | | | |
|----------------|-------------------------------|---|----------------|----------|---|-------------------------------|---|----------|---|-----|---|---------|---|---------|---|-----|---|----------|
| 2. | Wiring diagram of a T shunt. |  | | | | | | | | | | | | | | | | |
| 3. | Meaning of the terminal board | <table><tr><th>Screw terminal</th><th>Function</th></tr><tr><td>0</td><td>Earth (shielded cable sheath)</td></tr><tr><td>1</td><td>+VRL=30V</td></tr><tr><td>2</td><td>GND</td></tr><tr><td>3</td><td>Rx-/Tx-</td></tr><tr><td>4</td><td>Rx+/Tx+</td></tr><tr><td>5</td><td>GND</td></tr><tr><td>6</td><td>+VRL=30V</td></tr></table> | Screw terminal | Function | 0 | Earth (shielded cable sheath) | 1 | +VRL=30V | 2 | GND | 3 | Rx-/Tx- | 4 | Rx+/Tx+ | 5 | GND | 6 | +VRL=30V |
| Screw terminal | Function | | | | | | | | | | | | | | | | | |
| 0 | Earth (shielded cable sheath) | | | | | | | | | | | | | | | | | |
| 1 | +VRL=30V | | | | | | | | | | | | | | | | | |
| 2 | GND | | | | | | | | | | | | | | | | | |
| 3 | Rx-/Tx- | | | | | | | | | | | | | | | | | |
| 4 | Rx+/Tx+ | | | | | | | | | | | | | | | | | |
| 5 | GND | | | | | | | | | | | | | | | | | |
| 6 | +VRL=30V | | | | | | | | | | | | | | | | | |

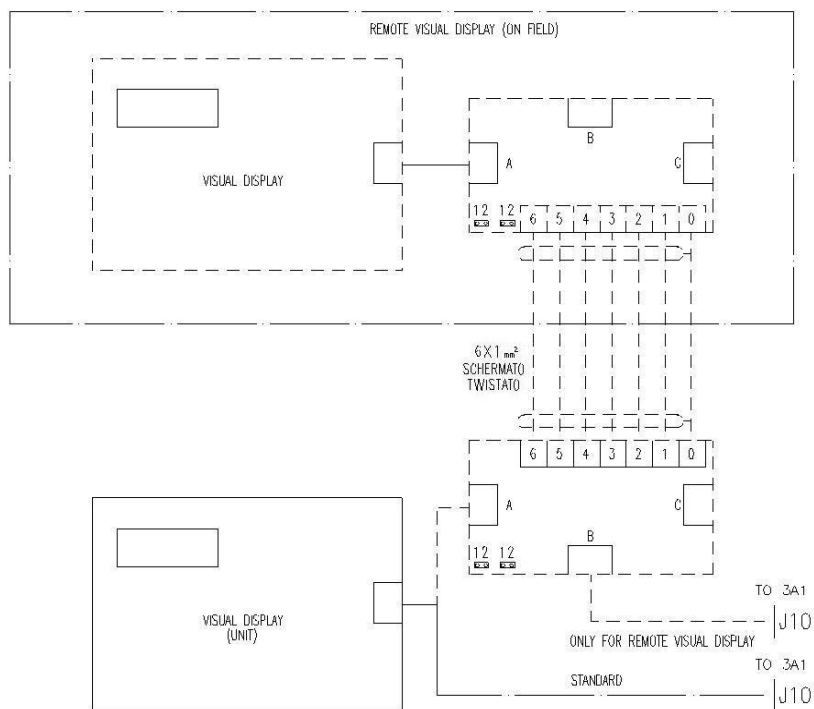

10.4.2 Remote keyboard up to 200 metres

To connect a remote keyboard two "T" shunt boards must be used, one near the controller and one near the remote keyboard.

If a remote keyboard monitors just one unit, the correct configuration is:

The wiring diagram is shown below.

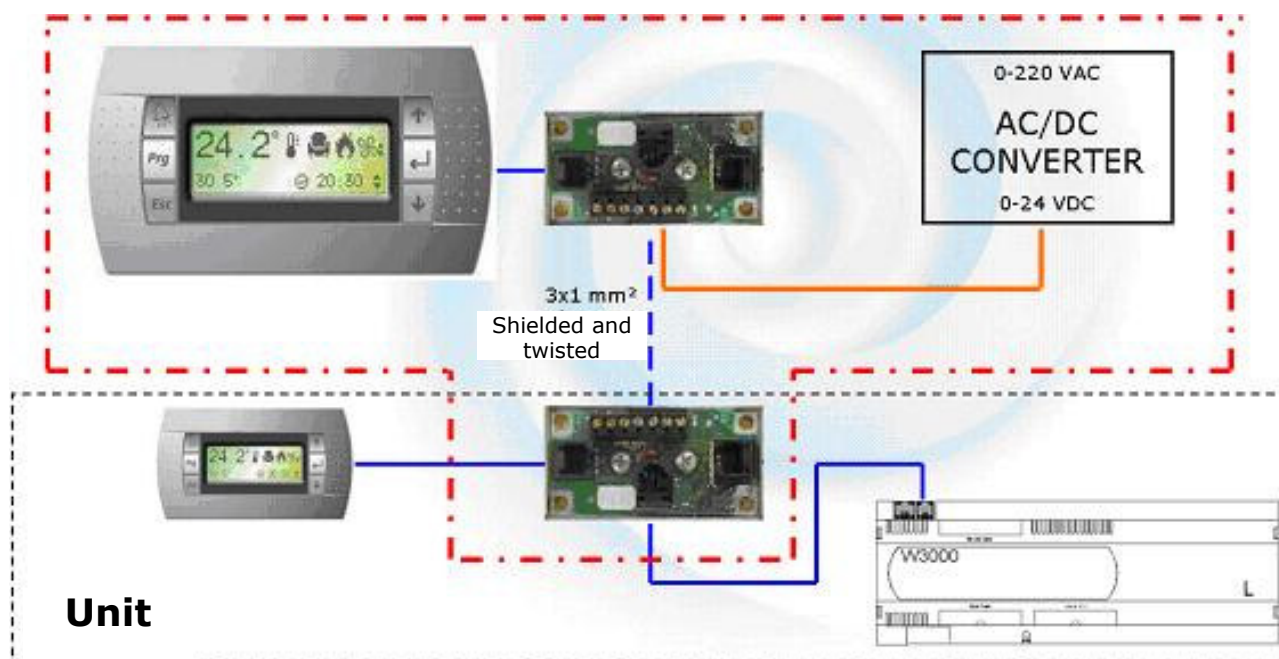

10.4.3 Remote keyboard from 200 metres up to 500 metres

If the remote keyboard must be installed over 200m away from the plan network, a power unit must be installed near the remote keyboard.

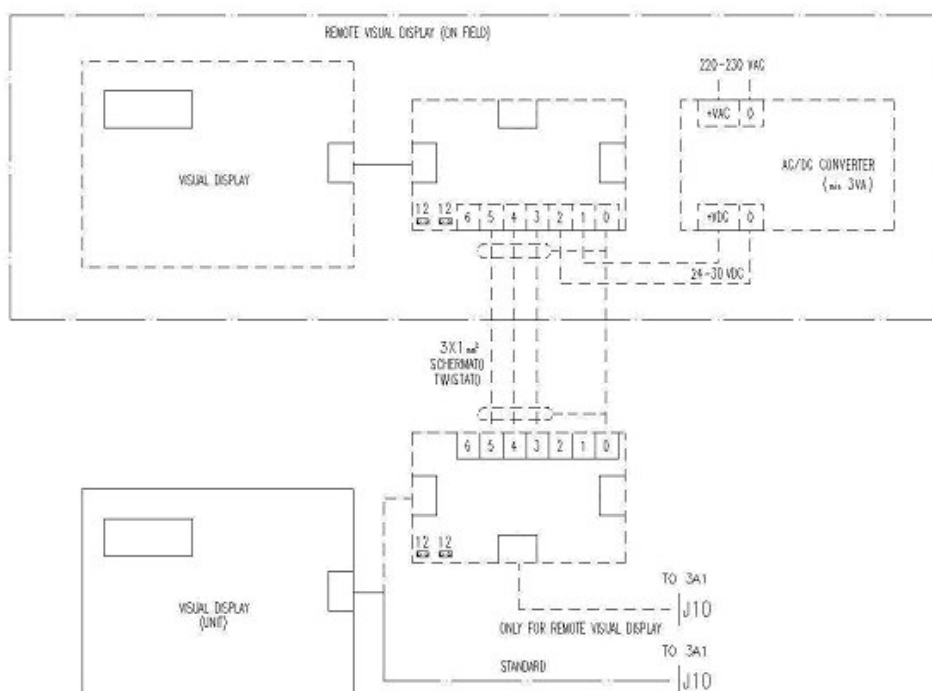

The remote keyboard cannot be installed more than 500 m away.

The only difference between this and a remote keyboard up to 200 metres is that the power unit must be to terminals 1 and 2 of the T shunt (the one near the remote keyboard)

If just one chiller is connected, the connection diagram is:

The wiring diagram is shown below.

10.4.4 Remote keypad for more than one unit

To connect more than one chiller to the same remote keyboard, connect the two boards together by jumpering connectors J11.

A configuration similar to the two shown above should only be used on the last board in the network (the one nearest the remote keyboard).

SYMBOLS

The following symbols are used in the W3000 and W3000 compact masks.

| Flashing items on main mask | Description |
|-----------------------------|---|
| Bands | Time bands active |
| Fcool | Unit in free-cooling mode |
| Limit | Power limit active (demand limit) |
| Freeze | Outlet temperature approaching anti-freeze setpoint |

| Unit symbol | menu | Description |
|-------------|-------|---|
| | Off | Unit/circuit off |
| | Ch nr | Chiller circuit not demanded by thermoregulator |
| | Ch | Chiller circuit demanded by thermoregulator |
| | Ch+R | Chiller circuit plus recovery demanded by thermoregulator |
| | Hp nr | Heat pump circuit not demanded by thermoregulator |
| | Hp | Heat pump circuit demanded by thermoregulator |
| | R nr | Recovery only circuit not demanded by thermoregulator |
| | R | Recovery only circuit demanded by thermoregulator |
| | Pd | Circuit in pump-down mode |
| | Defr | Circuit in defrost mode |
| | Drip | Circuit in drip mode |

| Chiller symbol | Description |
|----------------|-------------|
| chiller | Chiller |

| Chiller+freecooling symbol | Description |
|----------------------------|--------------------------|
| chiller | Chiller |
| chiller+fc | Chiller plus freecooling |

| Chiller+recovery symbol | Description |
|-------------------------|-----------------------|
| chiller | Chiller |
| chiller+rec | Chiller plus recovery |

| Heat pump symbol | Description |
|------------------|-------------|
| chiller | Chiller |
| heat pump | Heat pump |

| All-in-one symbol | Description |
|-------------------|-----------------------|
| auto | Automatic |
| recovery | Recovery |
| chiller+rec | Chiller plus recovery |
| chiller | Chiller |

| Heat pump with recovery symbol | Description |
|--------------------------------|------------------------------|
| summer auto | Summer automatic |
| summer rec | Summer recovery |
| summer ch+rec | Summer chiller plus recovery |
| summer ch | Summer chiller |
| winter hp | Winter heat pump |
| winter rec | Winter recovery |
| winter auto | Winter automatic |
